The first ones are really tounge in cheek:

"ATARI - Your Father's Video Game System"

"Atari - Family fun from sometime between caveman and XBox"

"Atari: #4 of the Big Three Computer Companies"
(back when it was Radio Shack, Commodore, Apple and Atari)

Now for some better ones:

[VCS 2600 graphic]
Atari 2600
XX Million Happy Customers
(I'm sure someone here has the number sold)

Atari Computers
[Atari 800 graphic]
Four Players - No Waiting!

(Line art of the old ad showing a family playing a 2600)
Atari - Fun for the Whole Family!

Hi,

I have a Mega STE, and, before opening it, i'd like to know if I can plug in
it the fllowing processors:

- un MC 68020 RC16B (2A70N8807)
- un MC 68881 RC16B (2B 81G QEXX8834)

Without soldering, of course....!!!

Guillaume.

No, you can't do that, even soldering would not help.

I could be wrong, but I thought Atari was #1 for a little while back in the
days before the VIC-20 and C=64.

I don't know about the no soldering part, but from info I found online, the Mega STe was supposed to have had an optional 68881 coprocessor, which means there should be a spot for one somewhere on the motherboard. If it's like the Falcon, you just need to buy the 68881/68882 and pop it in (making sure it's lined up properly, of course). Also, I've heard that you could use a PAK 030 accelerator. That would give you a 68030 running at up to 40MHz. There was also Veloce, I think. You'd definitely need soldering with these, though. Of course, then there's the issue of finding them! Good luck!

Hey guys, I was just poking around Wikipedia and noticed the entry for
Dungeon Master. It says it had 50% penetration of the ST market.

Does that make it the best selling/most popular ST game ever?

I was just curious as to what game holds that spot.

The CPU in the MSTE is Socketed and can be easily removed. It is square BTW.
With some upgrades, you have to remove the CPU and place it in another
socket on the
upgrade, which is the case with the Vortex 386SX upgrade.

The Co processor socket is located off the right corner of the 68000 chip.
It is square as well, BTW.
Which is on the left front of the motherboard, at the edge of the board in
fact.

According to the MSTE manual, the MSTE is 68881/2 compatible.

If anyone is using a 68882 in a MSTE, I would like to know if it works
correctly.

The MSTE is a great machine, and is really under-rated.

Putting a 020 in a MSTE is possible in my opinion. Not sure what you would
have to
do to get it to work. I remember some projects using a 020 in a ST. You
might try searching
on google for Atari Hardware pojects and the like, maybe you will stumble on
something useful.

Some 020s were used in early Falcons BTW. You could go to Motorola's site
and see if
they have any info on the 020 and 68000 to see what the differences are.
I have a Motorola 020 Manual, but haven't studied it yet.

Best of Luck.

Thanks for the info.

ST Basic didn't seem to catch on, like Atari 8-bit Basic did.
At least it seems that way to me.

Its good that some type of programming language is still being supported.
GFA Basic, I mean. Isn't GFA somewhat compatible with the PC version or
am I mistaken.

What happened to STOS?

Wasn't it a easy to use language, that gave some real power?

Anyone happen to have the latest version with manuals and some extra
programming modules or etc that they no-longer want?

I'd like to get the Falcon compatible version, that allows access to the
graphics
and sound capability of this machine. I think there were plug ins or
something
like that for the Falcon that allowed one to access different parts of the
machine
easily without alot of programming.

Greetings,

Need to know what the final version of Magic4 and Ease was?

And if there are updates that still can be gotten for free or pay?

I have at least version 4 of both.

Also, can Ease be used with Geneva instead of NeoDesk?

And how does Ease stack up to other desktop replacements such as
NeoDesk, and Thing?

Will Ease work on a TOS 1.04 MegaST4?

Dungeon Master on the ST was a great experience and I just loved it. To me,
however, the Ultima series was the best.

Hello,

I would like to exchange my 16Mb TT Ram board (4x4mb simms included). What I need is to complete my Mega STE with:
- one graphic card
- and one keyboard (TT/MegaSTE)

The TT ram board is fully operational: it was in my TT until this morning, never a single problem with it.

Guillaume.

Loved that series too Edward. I played 3-4-5 to death. I've got 6 but never completed it. VI even runs on my Falcon, and is hard drive installable. I have to say I'm disappointed in the graphics in certain areas of the game though. It looks like whoever ported it over used the original EGA (not VGA) versions for things like character portraits. Very ugly. Far less than what even a standard ST is capable of doing.

I guess 5 is my favorite. There is just something about the story of the Underworld and the Shadow Lords that holds my attention. Other little things as well, like when you do something wrong and the next town you go into has a wanted poster listing you and your party in it. Alas, mine won't run on my Falcon, just on my STs...

See ya.

PS Now that I've got my CT60 Falcon back up and running I guess I'll have to go back and try to finish Ultima VI... :-)

>correctly.

I have an 68882 in my MSTe.

The 68882 works correctly, but some software doesn't. The Pure compilers (both C and Pascal) make the 68000 wait for responses (to commands) which the 68882 does not supply so any program written in them which tries to use the fpu goes into an endless loop. Such programs can, however be patched to run correctly with the 68882.

LATTICE C programs work correctly with the the 68881 or 68882.

To add a 68881 or 68882 to the MSTe you need not only the fpu but also address decoding hardware - usually in the form of a GAL. The socket for this in on the board.

I don't think it was that good and there was no compiler, at least the
version that was packed with my ST did not have one which limits it for
producing programs everyone can use.

< cut >

> What happened to STOS?
>
> Wasn't it a easy to use language, that gave some real power?

> programming modules or etc that they no-longer want?

As Lonny stated the souce code has been made available for anyone to tinker
with and is available on the Click Team website or you can download STOS,
Manuals and Extensions such as 3D, Meastro, Missing Link, Cyber and Extra as

well as soem extra code bits for identifying STEEM form the STOS Megademo website at http://www.stos.atari.st. While STOS is primarily centered around creating games you can write applications with it if you wanted to.

> I'd like to get the Falcon compatible version, that allows access to the
> graphics
> and sound capability of this machine. I think there were plug ins or
> something
> like that for the Falcon that allowed one to access different parts of the
> machine
> easily without alot of programming.

There is the Falcon Extension by Anthony Jacques which can be found at http://www.btinternet.com/~AnthonyJ/Atari/index.html that will let you see what is is capable of although there is not complier for it, if you think it would be usefull after you have looked at it let me know as I may still have the complier extensions for it somewhere.
You should note however that you can not use it to produce a program that will run on both the Falcon and ST if it uses uses any commands from the graphics part of the Falcon extension as it causes an error when complied that prevent the program from executing. Even if you place a STOS error trap on the first line of your program you can not trap it as it is something the extension performs before executing your code (the audio part of the extension cause no such error). Anthony said it might be something to do with it setting/not setting things on even boundaries, I did not understand it myself however if you were planing to write for the Falcon only that should not be a problem.
STOS programs written without the Falocn extension will run on the Falcon although IIRC the desktop graphics can get messed up once the program ends requiring a reset, espically if it is run from the HD as IIRC auto folder programs loaded from a floppy are less prone to causing this problem.

Hi All

I have put a Multisync 14inch VDU on eBay. This VDU has a horizontal sync rate of 15-40 kHz and therefore is capable of displaying ST Low as well as ST High. Used with a Falcon it can show most RGB & VGA video modes.

Low starting price as I need to clear some space.

Follow this link:

5845. AtarICQ 0.167 is released (important update!)

Newsgroup: comp.sys.atari.st
Date: 2006-02-13 23:00:57 UTC
From: GokMasE <gokmase@gmail.com>
Message-ID: <1139871657.739487.278260@g14g2000cwa.googlegroups.com>
Source record: 9522

Hi all,

Have you been experiencing problems with ICQ last few days? Then keep
on reading!

Recently there have been some serious problems with a couple of ICQ
clients, aICQ being one of them. The problem has been that incoming
messages have not been received properly. It would have seemed like all
your friends were silent all the time. Thanks to some fast research by
Dan, there is now an update which should take care of this issue. If
you use AtarICQ, make sure to grab this update ASAP!

Other noticeable changes in the new release:

* Cleaned up the keyboard evaluation code

* Masked out all messages about oncoming contacts during the first
10s. (Some ppl reported server was lagging this data a bit, hence this
delay was added in order to avoid unnecessary console text)

* Some ICQ (spam) bots are trying to trick ppl to add them to
contact list by sending out signal that "user is online". That would
indicate that we have already added them to your contact list,
something that is not necessarily true. Since aICQ now supports the
server side list directly, some of these attempts will now be detected
and blocked.

* If contact list was empty, the option to "hide separators" would
crash aICQ. Solved by temporarily cancelling the hiding, until contacts
are added.

* In dialog for adding more contacts, the number of allowed chars
for UIN/ screenname has been increased from 10 to 16.

* In MagiC, setting both SELECTEABLE and TOUCHEXIT for an object
will make form_button() wait for the mouse button to be released. This
is now worked around, allowing the setting of auto-away time in
preferences to work smoother under MagiC.

Get the new AtarICQ release here:

Thanks, Peter!

so:

>> ESBJ> >And how does Ease stack up to other desktop replacements such as
>> ESBJ> >NeoDesk, and Thing?

Well, it's quiet an old desktop, but you won't guess from its appearance.
It definetively less configurable (and modern) than jinnee and others,
missing stuff like *nix access right support, but provides handy features
like directory-tree popups when you hold the mousebutton while pointing to
a (hard)disc icon on the desktop.
It supports most standard stuff such as icons for configurable file/folder
name masks, automatic launch of applications associated with the data file
you want to open.
Not sure, but desktop notes and hotkeys for launcing applications are
featured as well.

Regards,

Alexander

5849. TeraDesk 3.80 is available

Newsgroup: comp.sys.atari.st
Date: 2006-02-15 19:35:52 UTC
From: vdjole@EUnet.yu
Message-ID: <dsvvql$92a$1@news.eunet.yu>
Source record: 9526

Hello;

Version 3.80 of Tera Desktop (TeraDesk) open-source desktop is available at:

http://solair.eunet.yu/~vdjole/teradesk.htm

TeraDesk is currently the only open-souce desktop available for 16-bit and
32-bit Atari computers. Developer's goal is to maintain TeraDesk as a small,
simple, fast and reliable desktop, which can run on any TOS-compatible Atari
computer, clone or emulator and which can be be functional and competetive
in the modern multitasking environments and all flavours and versions of
TOS-compatible operating system(s), while keeping, as much as reasonable,
familiarity with the original TOS desktop.

Main new features in this release are related to a capability to pass names
of network objects, such as web pages and ftp sites, via the AV and drag&drop
protocols, and to assign such names as 'document types' to applications.
Supported name prefixes are currently http:, ftp: and mailto:; this enables
e.g. MyMail to work properly with TeraDesk, and makes it possible to open
network targets from the Open... menu/dialog if appropriate applications are
installed.

As a byproduct of these changes, names of network objects can also be assigned
as targets of symbolic links and desktop icons. It is thus possible e.g. to
have icons of favourite internet sites on the desktop.

A considerable number of not-very-obvious bugs has been fixed as well,
most of them related to handling of extremely long paths and filenames
(unfortunately, the bugfix code increased program size by about 1 KB).
See the history file for details.

Another point which may be of interest is that there may be, probably very
soon, Russian, German and French translations of this version of TeraDesk.
Links will be posted on TeraDesk home page as soon as translations become
available.

Users are advised to read the documentation before running the program ;)
Some features of TeraDesk may not be immediately obvious.

Have fun.

5850. HDDRIVER news: English manual

Newsgroup: comp.sys.atari.st
Date: 2006-02-15 20:08:40 UTC
From: Uwe Seimet <Uwe.Seimet@seimet.de>
Message-ID: <45hg28F6s18vU1@individual.net>
Source record: 9527

Hello,

As the Atari Workshop website has vanished and I have not been able to
reach Atari Workshop by email I have decided to offer the English
version of HDDRIVER *including the English manual* myself.
I am currently revising and updating the English manual. Users ordering
HDDRIVER 8.1 can now choose between the German, English and French
manual. The French manual only covers HDDRIVER 7, though.
For registered users of HDDRIVER 8.1 the current English manual is also
available separately. Please refer to
http://www.seimet.de/hddriverprices_english.html for details.

Remember that you can pay with PayPal, which ensures that HDDRIVER can
also be ordered conveniently from countries outside the EU without
having to pay high fees for bank transfers or sending the money in cash.

Best regards, Uwe

Hi Pawel - thanks for replying.

I've got one too. Its still in its package with original docs 'n stuff.
I don't know if it works or not. I remember buying it from Toad Computers
here in the States years ago, although like you, I've never used it.

Now I would like to install it in my Mega ST to try and get the increased
speeds for my BBS.

It does look fairly simple to install. I just have a few questions.

What 5v source from the motherboard would you recommend?

Also, do you know where I can get the pin layout of the MFP chip so I can
find pins 7, 10, and 16? I'm fairly sure I can find the dot for pin #1 and
count from there, but I just wanted to be really sure.

Thanks much!

If you have the time Rodolphe, maybe put it up on one of the better FTP
sites.
This would be a most useful program for anyone installing a FPU in a MSTE.

Thanks for the info.

A correction had to be made to the just-released TeraDesk 3.80- a variable was used uninitialized, which could cause starting of an application to -sometimes- fail with "Command too long" message. As luck would have it, this bug showed up for the first time only after the program has been released, although that particular piece of code has been made about a month ago.

As this was just a single correction and made immediately after the initial release, I did not update the version number; it is still 3.80, but release date is now February 16th.

Hopefully it will be all right now. I apologize for the inconveniences that this repeated releasing might have caused.

I appreciate the info guys,

I'll take a look at the STOS stuff, I am sort of interested in it and may need compiler
extensions for the Falcon. I remember reading about STOS for the Falcon in ST Format.

I am not sure if it will do what I would like or not.

With Atari 8-bit Basic, I am not a expert, but can program most things that I attempt with it.
I like that machine language routines can be used in it to speed things up and get to what you
want to do without alot of programming. But I'm not a expert at machine language by any means.

I like to mess around with graphics and sound on the ST-Falcon. Especially the Falcon and am
looking for a programming language that will allow me to play around with pictures, sound samples,
music files, video grabs (done with the Expose, VideoMaster Falcon, VIDI ST etc.) and the like.

I'm not looking to do alot of programming, but for example say I want to create a demo to run on
the Falcon that uses nice graphics, sound samples and even some color video. I'd like to find some
programs that already exist to display the graphics and play some music and or samples so that I can
just use those and build onto those and change things around.

It's fairly easy to find examples similar to the above on the Atari 8-bit, but I've never really found
anything like the example given for the Falcon or on the ST/E. Most good Demos for the Falcon
are done in such a way, that I find it hard to learn from.

Although the original Falcon Demo that Atari used, is somewhat helpful. I'm not sure what language
it was done in. But the demo is somewhat similar to what I would like to be able to do, by using
a program or programs as a guide to build on, change, program and etc.

Are there any small programs in any language available that one could use as guides for making
good demos, or messing around with graphics, video, sound samples and music on the Falcon,
as well as the ST/E machines?

If someone have any spare IDE interface, that will work on my
MegaST 4, please contact me at this e-mail: mugorjNOSPUM@gmail.com

Please remove the NOSPUM.

Thank you very much,
Marcelo.

5869. ST and MSA images back to real disks

Newsgroup: comp.sys.atari.st
Date: 2006-02-17 02:56:41 UTC
From: mugorj@gmail.com
Message-ID: <1140145001.831096.130700@g47g2000cwa.googlegroups.com>
Source record: 9545

Dear Atarians,

I would like to start this message saying that i'm really sorry
to ask something that i'm sure have been answered many times.
I'm completely blind in the Atari ST world. Been an Amiga user
all my life, and now i want to know the ST better.
I have an MegaST 4, and only few days ago i managed to get an
original keyboard. This machine is waiting for about 2 years for this
keyboard, so i can use it ! Now it's time to run some good software.
The problem is my machine is very "vanila". Just one disk
drive.
I have many ST disk images on CD, but i don't now how to make
real floppies out of them.
So i would like to know what's the best, easier, idiot proof
way to create these disks.
I tried some programs on the PC side, like the Makedisk, but
they doesn't work well on the ST. They refuse to boot. And when i read
them from the GEM desk, read errors are reported.
So i would like to know how can i do this from the ST side. Can
i use a null modem cable to access the disk images directly on my PC,
and then create them on the ST drive ?
Is it possible to create a RAMDISK on the ST, without any extra
software, so i can put some images there, and then create the disks ?
I'm really lost here.
Any help will be very much appreciated.

Thanks and Regards,
Marcelo.

I would rather recomend u GFA basic over STOS. As basic is a lot faster, offer structual programing, easy acces to OS and hardware etc.. True, no special ASM routs as in STOS, but easy to include own ones, which can in most cases be better and mre optimised as STOs ones... GFA is some kind of top in basic languages... VERY powerfull and also with great compiler so compiled code is not bad at all...

For any real demo effects u have to learn ASM... Can be done in GFA for example, but code is then sooo weird, ASM looks ultra easy compared to that and u still dont came close to ASM speed.. Maybe u checked my line of GemXXX players for Falcon, they are done in GFA, however all replay routines are ASM (68000 or DSP) since basic simply dont offer so much speed and cycle precision... Still u can do VERY nice and decent stuff from GFA as well, this wasn't meant as spolier :) I can help u with Gfa, im sure Loonny and others will do as well....

There is MSA (Magic Shadow Archiver?) on the Atari, as well as ST2DISK. Both might work for you, but I'm not sure if they require a Hard Disk or not. Then there's the problem of getting them from CD to your ST...

> I tried some programs on the PC side, like the Makedisk, but
> they doesn't work well on the ST. They refuse to boot. And when i read
> them from the GEM desk, read errors are reported.

Not sure why this happens, unless you are using the wrong disk type. PC formatted disks (as long as they are the same type as your ST floppy drive - no 1.44mb disks) should be readable on the Atari, but not necessarily the other way around.

> So i would like to know how can i do this from the ST side. Can
> i use a null modem cable to access the disk images directly on my PC,
> and then create them on the ST drive ?
> Is it possible to create a RAMDISK on the ST, without any extra

You can download freeware RAMDISK programs on various Atari FTP sites. This might work well for you, if you need it. Otherwise, make sure you have 720k disks (not 1.44mb HD), and either use MAKEDISK on the PC on them, if it will work, or transfer them on the same floppies to the ST and use ST2DISK or MSA. You can also use null-modem transfer, I believe, but I'm not sure how to do this, as I've never needed it.

Hope this helps you!

I believe its the Ghostlink software that you need for the null-modem
transfer, but like Mike, I've never actually used it either.

5874. SCSI transfer to PC HELP PLEASE!!!!

Newsgroup: comp.sys.atari.st
Date: 2006-02-17 17:45:54 UTC
From: "R.Johnson" <rayjohnson@mail.com>
Message-ID: <TTnJf.47033$T35.758404@news20.bellglobal.com>
Source record: 9351

Hello everyone,

I have 200 megs of important atari data files stored on a SCSI Maxtor hard drive. I have a Mega ST 4 with Tos 1.4. I can plug my drive directly into my PC and using Gemxplore I can see only the 1st partition. I've downloaded Parcp and couldn't get it working. Tried Atari to PC using Nullmodem 19200 baud (This is way too slow). I now have ARanyM. Unfortunately I'm not sure how to set it up using my SCSI drive. I have 7 partitions. The drive when connected to my ST uses an ICD 'The link 2" adapter along with the ICD software. I'm also running neodesk and warp9. Could someone please help me out with this. Thank you.

RJ

Hi
Have you tried setting up Gemulator to read your scsi drive on the pc.
The documents indicate that you should be able to do this ie.: read atari
scsi
drives from the emulated atari desktop and then copy your files directly
on to your PCs hard disc.

Maurice

Just a thought, but if you can see the first partition using Gemxplore and can copy the
files from that partition over to the PC, then do that and then delete the files you copied or
move them to a larger partition. Then start on another partition and move those files to the first
partition with TOS, then copy them to the PC and so on.

This will require you to move the drive between systems, until you get all the files copied.
And may take up more time than you would like, but would probably work if there isn't
another way that you can find.

If you had a CDR for the Atari and the proper software, then all you would need to do
is make a CD of the files.

If you still use the Atari, then get the latest CD writing software and a compatible CDR/CDRW
drive. Then you can make all the backups you want and easily transfer to a PC.

Best of Luck,
phantomm@bellsouth.net

5878. Re: ST and MSA images back to real disks

Newsgroup: comp.sys.atari.st
Date: 2006-02-18 00:02:17 UTC
From: mugorj@gmail.com
Message-ID: <1140220799.960918.321990@o13g2000cwo.googlegroups.com>
Source record: 9355

Hello guys,

Thank you all very much for all your help.
I think the Ghostlink is what i was looking for to transfer
the image files to the Atari.
As i have 4MB of memory, i think that creating a Ramdisk i can
copy some imagefiles there, and then use the tools you guys suggested
to create the real disks from the imagefiles.
I can imagine how boring will be this task, but it's the only
option i can think of right now.
I remember reading someqhere on the Internet, when i was
looking for some info on Ghostlink, that you can read files located on
the PC harddrive, as if they where on the ST, even if you cannot
execute .prg files.
If this is true it's much easier to create the real disks this
way, i think. Hope that the Ghostlink transfer rates aren't too much
slow.
This weekend I'll try to create some disks, and then I'll
report back to you guys what i can achieve.

Thanks again for your invaluable help.

Regards,
Marcelo.

Thank you Maurice. I tried Gemulator and could not use the program to access my SCSI drive. There is a program they make called Gemxplore which allowed me to access the 1st partition of my drive. I copied those files over. I have to select one file at a time only. Unfortunately I have 6 other partitions or logical drives to copy but Gemxplore doesn't recognize any of them. Even if it coul, I have thousands of files. Selecting one at a time isn't feasable.

Thanks for your reply

R.Johnson

Thanks for your reply. I thought about this and started it. Then I realized the 1st partition is so small in comparison to the other partitions. The remaining 6 partitions are 32 megs each. My main partition is only a few megs. Even so, I can only select one file at a time. I have thousands of files to copy. This would take way too long to do. There must be a quicker way. I used to have a SCSI cd burner that I paid $700.00 for. Then it cacked out on me eventually. I would love to have this now!!!

Thanks again for your reply

Aside from Ghostlink (which requires you to make a cable), I think your
best bet is either to figure out how to use Aranym (Linux can read ST
formats), or to use nullmodem. Although it's slow, zmodem would enable
you to transfer 200MB in about 30 hours -- just run it overnight a few
nights. If you know an Atarian with a SCSI CDR, you might also use
that.

Message-ID: <1140222848.880942.146910@o13g2000cwo.googlegroups.com>
Source record: 9359

Since my CTCM is heading back for repairs (pulled too hard), I need to get an oscillator. The only 66MHZ I can find are the full sized (14 pin) versions. My CT60 originally came with a half sized (8 pin) version. Does anyone happen to know if the CT60 oscillator pinout allows for the full sized version?

From: "R.Johnson" <rayjohnson@mail.com>
Message-ID: <P4uJf.6338$_D5.403507@news20.bellglobal.com>
Source record: 9360

Thanks for your reply.

I tried Aranym. I can't figure out how to access the SCSI drive with it. The documentation included only shows how to set up a SCSI CD rom drive. I used the nullmodem @ 19200 but the mail problem with that was I could only select 10 files at a time to batch download!!! Other wise I would just select a large group of files and leave the systems on overnight. There's got to be a better way. If I could get a hold of HDDRIVER I believe I could make the AranyM work. But I'm not going to spend $100.00 on something that a)I'm going to use only once and b)might not work.

Thanks again

R.Johnson

I was able to finish VI. It was a little slow, but it still was fun. Too bad none of the others (VII - X) was never done for the Atari. I did buy them for the PC, but have not as yet played them. Guess I had too much fun on my Atari. I played 1-3 on the Atari 8-bit and 4-6 on my ST.

Try PARCP between your PC and Atari instead. This involves a slight
modification to a 25 pin D plug-to plug cable, swapping two wires over
at one end. The speed is much higher than null modem, but does require
that your PC has a printer port.

Galen's right. You need to use Aranym, but I think you can only access atari partitions directly on a Linux PC. If you have temporary access to a Linux PC with a CD burner in it, you can use 'dd' to dump the partitions to files (7 partitions become 7 image files), then burn the image files to CD so you can get them onto your PC. Then its just a matter of editing the aranym config to map the image file(s) to logical partitions. Also, you will need to make a folder on your PC called HOSTDRIVE or whatever and edit the aranym config so that it can see this as a virtual atari hard disk. Once aranym reboots you can then access the files on your partitions, and then copy them into your virtual HOSTDRIVE so you can get to them as normal through windows. If you read the aranym howto you will understand (hopefully) what I have just written.

Best of luck, post here or email me if you need any further help.

Coda.

Yep, there is a 14 pin DIL socket on the CT60, which can take either size oscillator. If you have a close look at the circuit board you will see the traces connecting the relevant pins together.

Coda.

You can try the demo version, which may help you to decide whether it
would work.
HDDRIVER is not $100, by the way, but rather about $70. Whether this is
too much for something one would not need often also depends on how much
time one would have to spend without it.

Hi,

It looks like if <http://www.atari.org/> server is down.

Is that the same for everybody ?

Can we have news from them ?

Best regards,

I was thinking about that as well. I would like to exhaust the
possibilites first of utilizing the hardware I have right now.

Thanks for your reply.

I might consider this option, however I have no idea how the program works or more importantly how can it work for me? I need to transfer the contents of my 213 meg External SCSI hard drive to my PC as quickly and as painlessly as possible. I have 8 partitions that were made with my ICD Link 2 and ICD software version 6.5.5. The 1st partition is about 4 megs and the other's are equally 29.5 or so megs each. I'm using an adaptec 2940 SCSI card on my PC. I can boot with either Win98 or XP Professional. Can I use HDDRIVER it with Aranym and is it necessary? How can I use the demo version to see if this will work for me when there's no english documentation specific to my situation. If you can offer any help I would appreciate it.

Thanks for your reply

Thank you for your reply. What you're saying sounds excellent.
Unfotunately I don't know how to use Linux. Could you please walk me
through this process? I read that you could destroy the partition table
using dd if you're not extrememly careful. I would really appreciate your
help bigtime. And I do have a burner on my PC. Also what kind of driver is
needed to run the burner on my PC if it's being accessed through the ST and
what software would be needed?

Thanks again.

I am not completely sure about this, but isn't his partitions small enough
that
DOS should be able to see them?

I thought that as long as the Hard Drive was setup with small partitions,
that
they were compatible with DOS. I know that this is how it is when using a
PC hardware board on an Atari.

I don't know anything about Gemxplore, but it does see the first partition
which is about 4 megs.

I'd like to know why the other partitions are not being seen since they
are under 30megs?

Maybe it has something to do with the software that formatted or setup the
drive?

I was thinking that there maybe someway he could access the drive on the
PC using DOS.

Ray, Do you happen to have another SCSI drive that you can use on
the Atari ?

Thank you for your reply,

I'm not sure exactly about this as well. Maybe someone could expand on your idea. I don't have another SCSI drive for the ST. Why do you ask? Is that to test out what you are talking about?

Thanks.

R.Johnson

Don't have anyone at all near you that you could borrow a SCSI burner
from? Using ExtenDOS and a burner you could backup your 213 meg HD in one
go. Then read it all on your PC.

I think the Aranym docs tell you how to do it. I dont have time right
now, but in the meantime have a dig around, and look at the man pages
about 'dd'. The basic structure is:

dd if=/dev/<partitionx> of=/<directory>/parition_image.bin

you may need the 'bs' option to specify blocksize. Again look at the
Aranym and 'dd' man page.

Coda.

The best thing I could think of is using a live LINUX CD like KNOPPIX.
A KNOPPIX CD has been shipped with many computer magazines.
Perhaps you have one laying around or perhaps a friend nearby has one.

The CD installs a Linux system in your computer without writing anything
to your harddisc. It also installs a GUI desktop.
If KNOPPIX detects the ATARI partitions you can directly copy the
files on your PC HD using the Linux desktop just as you
would do on a ATARI.

It sounds good but how would I do this? I've never used ExtenDos. I can
get an external burner. The guy said it has the smaller ends, not like the
on my current Scsi Hard drive. So 1st I would need a large (printer style)
end to a small end Scsi cable. From there, I don't know how to run this
Extendos program on top of my current atari ICD controlled system.

Thanks for your reply.

5907. [UTD] ARAnyM packages

Newsgroup: comp.sys.atari.st
Date: 2006-02-19 06:54:39 UTC
From: Francois LE COAT <lecoat@atari.org>
Message-ID: <43f8162f$0$20179$8fcfb975@news.wanadoo.fr>
Source record: 9384

Hi,

You may be interested by the following uptodate snapshots of ARAnyM.
Very latest changes on fVDI/Teradesk have been taken into account.

- The Pack_3D at <http://ebmodel3.atari.org/Pack_3D/>
that works on 3 OS/platforms including Windows, Linux and MacOSX.

It includes ARAnyM 0.9.2pre1 and

EmuTOS 0.8.1 version (also works with TOS4.04)
HDDriver Demo
FreeMiNT from Jan 29 2006
MyAES 0.80 beta from Jan 18 2006 (only available in this pack)
TERADESK 3.80
EB MODEL3 3.61d version (only available in this pack)
EUREKA 2.12 beta from Feb 06 2006 (only available in this pack)
KRONOS 1.71a
QED 5.0.5
POV 3.1g
INSHAPE3 Demo
ZVIEW beta 7
MESA_GL 0.93 version (derived from Mesa3D 2.6)
CAB 1.5
HYP_VIEW 0.35.2e version

ready to start with.

- The minimum pack at <http://eureka.atari.org/pack_aranym.zip>
that is built for Linux.

- The minimum pack at <http://eureka.atari.org/MacAranym.zip>
that is built for MacOSX.

Enjoy :)

> way, i think. Hope that the Ghostlink transfer rates aren't too much
> slow.

You probably read one of my posts ;-)
I've been using Ghostlink for years and, except a few failures from time to time, it worked great.
The transfer speed is rather slow, but you can access your PC drive directly from any software. So you can ask your Atari software to write back a file that you will select on the PC drive, then go away and have a drink: the ST will transfer the file and write it, you don't have to be there (of course d'ont forget to insert a blank disk ;-)

Later I moved to SCSI Link with HDDriver and a Iomega Jaz drive, much easier and faster... But not really cheap!

Good luck
Simon

PS: what really saddens me is that the Ghostlink authors seemed to want to use the parallel port, which would have been much faster... But no news since (that must have been 12 years ago ;-)

5909. Re: SCSI transfer to PC HELP PLEASE!!!!

> out with this. Thank you.

What I say may sound stupid to you but...
If you only want to access your hard drive and make a backup of it once
for all, Ghostlink and its 19200 bauds could be the solution.
Why ?
Because you can put all your files in a single folder on the ST side,
then transfer this folder (so your complete HD or partition) directly to
the PC.

Then go to bed, at work, the transfer would be something like 1 day long
for 200MB, but you don't have to be there. Just consider how long it
will require you to try another solution. Assuming you don't need your
ST and PC for 1 or 1.5 day, that's what I'd do.

Of course other solutions like Aranym seem much better - but I don't
know them. Try to have a look at the French newsgroups, I think someone
made an easy-to-use Aranym version for Windows - not sure about the HD
access though.

Cheers
Simon

5910. Thank you everbody!!! The files are copied!!!

Thank you to all of you who replied. I managed to finally and painlessly copy all of my 3000 + files over to my PC from my SCSI atari drive. I ran the knoppix ISO Live CD (http://knopper.net/knoppix). It detected all of my SCSI partitions from the Atari. At first I had trouble because it wouldn't let me write from one drive to another. So I created a directory to copy the files into underneath the 'Home' directory. Then I burned those files with 'K3'. I couldn't believe how easy it was to do. What a nice graphical evironment it is. I thought that it would be like DOS with the command prompt but it was like a better Windows.

Thanks again everyone. I really appreciate your help.

That was a great idea of Henk's to use a knoppix live CD. It never
occured to me that a live cd distro would have atari filesystem support
available from the 'get-go'. I'm going to have to check this one out
myself. I think I may still have a peecee around here somewhere :-)

Very interesting indeed! This should be noted in the ST FAQ as this
problem comes up
from time to time.

I know I have a few of these CDs around myself.

5913. Using Large Hard Drives on Ataris

Newsgroup: comp.sys.atari.st
Date: 2006-02-19 15:38:07 UTC
From: phantomm <phantomm@bellsouth.net>
Message-ID: <Ve0Kf.5042$ak2.3328@bignews4.bellsouth.net>
Source record: 9390

Have a question regarding using very large hard drives on Atari Computers.

AFAIK, TOS 4.04 only allows around 1 gig per partition.
Which limits total usable space of around 15 gigs more or less.

Is there any use for a 80 Gig IDE or SCSI hard drive on any Atari?
In other words, can the extra room on such a large drive be used in
any way?

phantomm@bellsouth.net

Yes, by using FAT32 (MagiC or MiNT) or Linux ext2 (MiNT) partitions.
Even without FAT32 or ext2 you can use more than 14 FAT partitions with
MiNT or MagiC (MiNT up to 31, MagiC up to 25).

FreeMint is your friend. Install it and you can use all the space
available.

I think there should be a web page with how to do this so that when people like myself who wanted to transfer from ST to PC wish to do so, they can be instructed how. I must have spent about 24 hours researching the Atari links, going through emulators and websites etc., trying everything and finally I got it working. The problem with Knoppix is that by default, you cannot write to either the PC drive or the Atari drive. I believe it's because of the basic permissions set up by default to protect the beginner users from writing to the drives by mistake. So I created a temp directory under the 'Home' menu(a 400 meg ramdisk), copied the ST files there and then burned them with the burning program called Eb or E somthing. You can access it from the little 'Gear' symbol on the bottom left where the start menu button in Windows is and then it's uder something like uttilities or something like that.. It was that easy. Maybe 10 - 15 Minutes at the most!!!

Thanks again everyone. And by the way, when it was first suggested to use Knoppix I was hesitant to do so because I know nothing about Linux. So my friend also suggested it and I saw for myself at his house what it looked like. I was impressed. If you're used to Windows, Knoppix is even better!!

I am very happy to hear my idee worked so well.
Knoppix came to my mind when somebody mentioned Linux in this thread.
I didnt know whether it would work, but I knew that Knoppix originally
was designed as a 'system repair' tool.
So my second thought was that Knoppix might noy br as picky on file
system identifiers as most other PC operating systems are.

I have a SCSI card on my PC as well.
It is great to know that it is so easy to get my TT HD content on my PC.
Be it for backup, or for use with Aranym.

Have a nice day ;-)

Hi there
Just got a Falcon 030 (4mb no hard drive) and want to add some storage and maybe a flat screen. I fancy a CF card solution as they are quite cheap and quiet. I've an STE with an old Atari hard drive thats too noisy. Is there anyway to connect that to the Falcon ? I've also got an STE with an internal IDE drive, would that fit ?
I remember seeing on eBay an adapter for using PC monitors with a Falcon, anyone tried one of these ?
One last thing, can I add the Falcon to my PC network ?
Thanks for any advice.
Cheers
Jammer

If this is a 2.5" drive it will fit. If it is a 3.5" drive you can use
it as an external drive and connect it to the Falcon with a stock 2.5"
to 3.5" adapter.
A CF card connected to the IDE port with an IDE CF adapter will also
work, there are several Falcon users already using one.

First of all, congratulations! These are truly wonderful computers.
Falcons are getting harder and pricier to find these days. :-)

1 The external drive, if its a SCSI (which it should be) will work with
the Falcon. You might have to search around a bit to find the proper
cable. Also, any adapter won't be needed.
2. You can use 2.5" IDE drives inside the Falcon. It has a built in
interface for that.
3. There are 3 adapter types for the Falcon; RGB - for use with Atari
brand monitors like the SC1224 and SC124, VGA - for use with virtually any
PC monitor, and multisync, that gives the ability to do both RGB/VGA if
your monitor will support lower (15k) horizontal for RGB.
4. There are a couple of options to network a Falcon. You can use the
EtherNEC (cartridge port), or if you're lucky enough to get your hands on
a CT63/CT60 accelerator, you can get Natures' EtherNAT. Those are the ones
I'm familiar with. I'm sure there are a few others as well.

HTHs.

After some quick research, it looks like a 2 1/2" drive will do the
trick, it will just plug in and work, with a bit of formatting I think.
What height drive, is 9mm Ok ? and where can I get a cable ?
Also does size matter :) ? all the drives on eBay are 10Gb plus.
(I might just pinch the drive out of my STE)
Thanks again.
Jammer.

It was down to .56 per share after they made their announcement of
financial status, but has rebounded back to what it was originally
before then. They just announced a restructure which will help put
them in a profit making position again within the next year.

Yes, 9mm I think will be okay. Do you know if you're Falcon has the hard drive mounting hardware in place? If not, you may have to try to pick it up. You should be able to get cables from just about anyplace that sells HD stuff. Specifically, Best Electronics and B&C Computervision are 2 Atari dealers that just rule.

You can use the 10gig models no problem. At this point, I have to recommend spending some dough on HDDriver. IMO, its the best hard drive software for Atari computers. Uwe Seimet posts here often, and gives great support.

You're gonna have lots of fun. :-)

Note that some old IDE drives may be damaged when formatting them. As long as a drive has no bad sectors formatting does not make sense anyway. The filesystem layout is what is important, and this is created by partitioning, not by formatting. In other words: Partitioning is usually all one needs, even when a drive was formerly used with another operating system.

I now have a 66MHz oscillator happily running away in the CT60. My CTCM was apparently the reason behind the inability to boot -- it somehow got something corrupted, and I was without my speed for a couple of months until something someone posted on ct60.dhs.nu gave me the inspiration to try a replacement clock.

A Falcon at 16MHz is very usable -- one at 66MHz is very pleasant!

Galen

Ok. I've gone for quite a while without replying to you. Sometimes I agree with you on some or all of your points. Other times, I just ignore your posts. But when you disrupt productive discussion (at least for those of us who actually use and enjoy our Atari's), that's just *not cool*. Please stop this childish idiocy. I know people have told you this for years, and you haven't listened, so maybe I'm just wasting my time. But I just had to say *something*.

I know you're a Mac guy. I have a Mac that I'm using right now to write this. But I have to tell you, aside from Internet use, which I admit Atari's aren't even close to being useful with, I hardly ever use the Mac for real productivity. I use my CT60 Falcon. Maybe it doesn't have a "modern OS" as you say. Who cares?! Does it really matter how many cool bells and whistles an OS has if it doesn't meet your basic needs, where an older, not so flashy OS works beautifully? The OS I use (Magic 6), when configured correctly and with the nice add-ons available now, is *much* better, in my opinion. Yeah, it may not have all the bells and whistles of MacOS X, but so what?! It does what I need it to do, the way I like to do it, which MacOS doesn't. MacOS (and Windows to an even further extent) really annoys me on a lot of points where my Falcon shines and is very enjoyable to use. I can fly through a project on my Falcon, while I keep running into frustration because the OS is so stinkin' inefficient for what I do with it. The Falcon is so much more superior to my Mac as far as how I like to work. That's just my opinion, and you may not agree, but you're not me.

Oh, and just to stay on topic... Galen: great to hear you've got your oscillator replaced! :)

Looking for the following Items....

Matrix Screen Eye Digitiser for Atari Falcon

68882 Co-Processors for Atari Falcon from 16 to 33mhz. (Need at least 3
maybe more)

Co-Processor for 386SX. To use in ATonce 386SX board for Atari MSTE.
(one out of an old 386SX PC should work)

TOS 1.62/2.06 unit for 1040STE. Must be able to switch between Tos versions.

Atari Falcon Field Service Manual.

A Unit that connects to Falcons DSP that allows more input/output ports and
or different
recording recording frequencies. Open to all types of these units made.
(Have Cubase Audio Falcon, Dongle, and DSP clock.)

Non Working Atari Computers of all types. Especially Atari Falcons. Could
use a non working
Stacy or two.

Stock Falcon, MegaSTE, TT cases. (Where owners have recased there machine
and no longer
need the Stock case).

Mega ST, MegaSTE, TT working and non working keyboards.

English Documentation to install a OverScan Board in a Mega ST.

Apex Media versions between 2.00 and 2.41 (Manual is not required)

ICD ADSpeed Accelerator (working)

Various PC emulators on boards (working)

SYQUEST Units for Ataris (working)

Replay 16 Cartridge, software, and manual (working)

Any other Atari related items, can be submitted as well. I'll consider any
thing.

Also looking for older External CDROM drives and Hard Drives.

Will trade other Atari Items or purchase for the above items.

OverSeas Items are welcome.

Send list of what you no longer need to me at:
phantomm@bellsouth.net

If you have a SpareMiNT system and are interested in sudoku: I recently uploaded a very nice sudoku solver/generator to the sparemint website. Sources and Binary are available there as SpareMiNTRPM package.

It has a curses interface and runs nicely in my Toswin2 window. Only the keybindings need some improvement: The cursor keys don't work , but you can move the cursor using the vi(m)-style h-j-k-l keys.

I also ported another Sudoku solver called "Suds". Nice bookmark test. To solve an extremely difficult Sudoku on my Atari 1040 STf took approximately one minute. My Falcon030/CT2b needed 5 seconds. On my Aranym emulator it's a matter of milliseconds :-)

Our old Atari user group still meets monthy to chat (none of us still have our old boxes) and the question was asked - are there Atari clones being developed (like the Hades) in Europe or elsewhere and, if so, how are they doing ???

I still think Atari's "TOS on ROM" was the best idea ever developed.

5954. Gemulator 98 CD

Newsgroup: comp.sys.atari.st
Date: 2006-02-23 23:37:26 UTC
From: phantomm <phantomm@bellsouth.net>
Message-ID: <2ErLf.56963$697.42630@bignews3.bellsouth.net>
Source record: 9181

Been looking at the Gemulator 98 CD that I recently got.

Was there a hardware device that came with this CD?
If so, is it a must to use the ST emulator software?

Not sure if I have the manual for the CD, will have to look around.

Was wondering if this was the last version of the CD and if this version
will work on XP?

www.emulators.com was down when I last checked.

Does anyone in the group use Gemulator any more?

If so, Does the ST emulator software work well, and will most ST software
run on it? Also, does any Falcon only software work?

I wouldn't mind being able to run a few ST programs on my HP or Sony LapTop
using the Gemulator 98 CD if possible. (Both Laptops run XP)

I've never ran any Atari emulation software on a PC before.
I do have the ST Xformer Cable and SIO2PC Device.
I have experience in transfering Atari 8-bit files to the ST/Falcon.
I've not used the SIO2PC device yet.

Any thoughts or tips on using Gemulator?

phantomm@bellsouth.net

5955. Storage Devices on Ataris

Newsgroup: comp.sys.atari.st

I'm looking for some other type of Storage Devices to use on
Atari ST-Falcon, other than hard drives and CDRW drives.

I know about SCSI Syquest Drives and similar devices,
what other type of SCSI or IDE Storage Devices can one use?

I'd like to be able to do D2D recording on any SCSI devices
if possible, but not necessary.

Do you see the four screw mount points between the floppy and the power
supply? That's where a little quadrapod (4 legged tripod) is placed.
The 2.5" drive sits on the quadrapod.

Galen

Gemulator had an optional hardware device. However, without the hardware card you can still use it if you have a copy of TOS as a file. Gemulator 2000 could find the TOS file in various places, but early versions have to have it named MAGIC_PC.OS and located at C:\ (the root of the boot drive). I do use Gemulator under Win98, so I'll try to help. Note however, that STeem has come a long way, so I am starting to prefer it.

That is not a modern OS.

The kernel concepts are 35 years old.
The hardware models are not as good as 40 years ago.

The rest is applications benefiting from speed and
volume, which are the only modern aspects.

This is less a question of software but rather of the available
hardware. For CF cards cheap CF to IDE adapters are available. If
similar adapters exist for other cards HDDRIVER is most likely capable
of accessing these cards in the same fashion.

So I'm starting a new thread, which people can weed out with filters...

sinclap@yahoo.com wrote:
> Typical 90's response.

What the heck does that mean!?!?!

> I can't run Metatrader on a ST, as well as my iLife suites. The OS has
> not kept up.

Just because you can't run very specific software on a very specific OS doesn't mean that the OS hasn't kept up. There is a *lot* more software for Windows that's considered "modern" that doesn't run on MacOS. Does that mean that Windows is more advanced than MacOS?

And just because Metatrader and iLife are apparently very useful programs for you, doesn't mean that anyone else necessarily cares for them.

Need some specifics? I listen to streaming audio quite often, even though I'm on a measley dial-up system. FalcAmp on my Atari running on a 31.2k connection can maintain a stable connection *way* better than iTunes on my Mac running on a 49.3k connection can. So, I use FalcAmp. I also use Aniplayer more often than iTunes. The only advantage that iTunes currently has for me is that it can run some cool visualizations. But that's just meaningless fluff, albeit entertaining at times, and I rarely use it. So iTunes, which is a "modern" application by your standards is pretty much useless for me, in areas where FalcAmp and other Atari-based programs are extremely useful.

Another example: People send me MS Word files and Word-created RTF files all the time. Papyrus on my Atari seems to handle them a whole lot more accurately than AppleWorks. There was one case where AppleWorks couldn't view an RTF file made by Word. I loaded it into Papyrus just fine. I then saved it again as RTF. The file size went from 30k down to 7k, and AppleWorks read it just fine. Does this demonstrate how dumb both Word and AppleWorks are, where Papyrus is superior? Not nessecarily, but it does show that it's more useful for what I do.

No one argues with you that an ST isn't modern (that's why I have a Falcon, not an ST :)). It's 1985 technology, or hasn't anyone filled

you in? There are Atari's, upgrade cards for Atari's, and Atari clones that are closer to being modern, but again, none of them are state of the art. That's not the point, which I guess is something you don't seem to be able to understand. We enjoy it none the less. Who cares if it can or can't run the software you mention?! By the way, can you run these pieces of software you mention on Linux, which is a modern OS? I would guess not, but I'm not sure, so that's a legitimate question. Also, Atari's *can* run Debian Linux and have a "modern" OS, if we want to. Most don't because Magic or Mint serve us better, and work faster without losing any usefulness. And guess what! We have an OS that's dated 100% within the 2000's - Mint, XaAES, and Teradesk. Ok, not quite "modern" by your standards, but who really stinkin' cares?

There are people who have and truely enjoy '57 Chevy trucks. Oh my gosh! They can't go 0 to 60 in 0.2 seconds, don't come with XM Radio, GPS, and OnStar, and aren't Hybrid or can't run on E85! But they enjoy them for what they are, and some even find good uses for them.

THAT'S THE POINT! (smacks Sinclap upside the head)

I use a CT60 Falcon, not because it can run the latest software suites, not because it's got the most "modern" OS, and not because some corporate machine named Steve or Bill says I should. I use one because I enjoy it immensely, and ***it gets the job done that I need it to do much better than my Mac can, believe it or not!*** My Mac is basically a dumb internet machine, and that's it. I only have one because my Falcon can't to Web Browsing very well, and I can't stand Windows. When/if ever they can get Web Browsing up to date on Atari machines, I'll probably never use my Mac. Whether this is a "typical 90's response", I don't know, and I don't really care. I use what I use, and you can't tell me that my machine isn't useful enough, because you aren't me, in my situation. If the Mac does what you need it to do the way you like to do it, then I'm very happy for you. I'm not telling you to use an ST, and no one else here is. I really don't see where you get this dilusion from.

Now go play with iLife and give this stupid ranting up.

They work as well. All in all ZIP and JAZ drives are nothing special,
just one kind of removable media drives.

Interesting piece of hardware! Was there a driver for GEM of did you
have to work always with two screens: one with GEM and the other with the
special software written for this graphic board?

On the photos we can see 4 connectors on the back side of it. I suppose:
- parallel input from the ST
- parallel "thru" to chain the printer (seem to be a RS232 output)
- VGA out
- a SCSI connector.

The board seem to be limited to 4 planes (16 colors) and can be enhanced
to 8 planes (256 colors).

But the seller doesn't ensure that it works...

Guillaume.

Yes I have those, but it is commercial. A lot of the Atari Dealers still sell
Magic but you can get it from ASH (Applications Systems Heidelberg).

I have a Hades060 and have been using it since 1996. Great machine, however it is not being made anymore. The clones are not either (Milan, etc), but they do still exist and are being used and sold.

I have seen demos on the Net for download. It would seem that you should be able to get it as it is an old program. You might try searching for Quick ST which also worked very well. There are some others on the Net that worked pretty good on the ST.

Anyone know if there is a program that will produce a PostNet graphic picture of various US postal codes that is made for the Atari? I know Gemvelope will do it, but I use Calamus for printing envelopes. I was hoping that the 2006 upgrade of Calamus would have this, but it did not.

Yes, it has been sitting unused for a very long time so it would be better if somebody else gets a chance to play with it!

> Was there a driver for GEM of did you have to work always with two
> screens: one with GEM and the other with the special software written for
> this graphic board?

The ParSec was designed to connect to a 2nd monitor, which was used for primary output. The ST could of course still output to its own display so you had a dual-display setup (ST monitor for main dialog boxes etc. and ParSec for graphics and other appropriate menus/toolboxes if needed).

The ParSec was responsible for all drawing to its own display of course.

> On the photos we can see 4 connectors on the back side of it. I
> suppose:
> - parallel input from the ST
> - parallel "thru" to chain the printer (seem to be a RS232 output)
> - VGA out
> - a SCSI connector.

That is correct. The RS232 is one of the ParSec's own communication ports as it is effectively a computer in its own right, albeit one designed for drawing to a framebuffer.

The VGA port however I think is an 'old' style one, and may need an adaptor for a standard VGA monitor these days (Although that is from memory - I can't be sure about that now!).

> The board seem to be limited to 4 planes (16 colors) and can be
> enhanced to 8 planes (256 colors).

Yes, thats also correct. The enhanced version supported 256 colours from a palette of 16.7M.

> But the seller doesn't ensure that it works...

Unfortunately not. It is untested. However it hasn't been messed with since it was made, and came from the original company (ElmTech) so chances are good that it works. It is just unsold stock.

Doug.

Hi Martin!

Do you have F11 and F12? This is where Undo and Help atari keys map in
most of the emulators and even for ARAnyM. We might want to make it
configurable but so far we didn't find any user not having F11/F12 on
his PC keyboard.

Best Regards

|This is less a question of software but rather of the available
|hardware. For CF cards cheap CF to IDE adapters are available. If
|similar adapters exist for other cards HDDRIVER is most likely capable
|of accessing these cards in the same fashion.

This is interesting and I apologise if I cast any aspersions on
HDDriver!

I've got two SCSI/PCMCIA card readers and both read CF cards without
problems. Put another card in and I've tried two SD cards and an xD
one and you get a ping and the card doesn't respond. Try the PCMCIA
adapter in a laptop and you can read whatever card is in it.

I'll get another PCMCIA adapter for SD cards alone and see if that
makes any difference.

This is only normal if there are three partitions on a device.

Two general hints:

- My database says you are using HDDRIVER 8.0. 8.1 may be a better choice for CF/SD cards since it contains changes that were relevant for certain CF adapters. I suggest that you try the demo version.
- Like with any other device SD and CF cards must contain a valid Atari-compatible partition table. In other words, one must partition them just like a hard disk drive. Otherwise TOS will not recognize them. Did you partition your cards before trying to access data on them?

...Just the software that comes with it (the art package), and any you might want to write yourself using the comms. info at the back of the manual :-) I think Jeff Minter did basically this when he got his hands on the first prototype. Its mainly of interest as a programmable GPU & framebuffer for the tech oriented, or as an Atari curiosity piece. I wouldn't expect it to be tremendously useful for the general user.

Doug.

Just to make it a bit more precise: If the file systems are MSDOS-FAT or
VFAT etc. the card can be read by MagiC or MiNT. The hard disk driver is
not responsible for dealing with the actual partition data; it does only
ensure that the operating system gets access to the partition meta data
like partition IDs and start sectors. Everything else depends on the
drivers for the file systems on these partitions.

Since the number of icons displayed by TOS depends on the number of
partitions found I assume that you have two partitions on your cards? Or
am I missing something?

|> works.
|>
|> One thig I had noticed with these readers is that I get three desktop
|> icons. Is this normal?

|This is only normal if there are three partitions on a device.

I was thinking this but I know that some versions of this drive have
three slots. There are three sets of jumper pins inside but the
manual only refers to the set that allocates the ID's.

|Two general hints:

|- My database says you are using HDDRIVER 8.0. 8.1 may be a better
|choice for CF/SD cards since it contains changes that were relevant for
|certain CF adapters. I suggest that you try the demo version.

I'm up to version 8.16. I got an upgrade last year from Atari Workshop.

|- Like with any other device SD and CF cards must contain a valid
|Atari-compatible partition table. In other words, one must partition
|them just like a hard disk drive. Otherwise TOS will not recognize them.
|Did you partition your cards before trying to access data on them?

Initially I tried them out of the box. CF cards worked fine like this.
The SD cards didn't respond so I tried to partition them. Each time
it comes back with the message "couldn't read root sector". I think it
was this that made me think they wouldn't work hence my comments.

If I remember it was you brought my attention to this reader!

The camera is a Canon IXUS 50 and came with it's own 16Mb card. I
later bought a SanDisk 512Mb Ultra II card. Both act the same.
Unfortunately the manual for the camera is in French. I couldn't see
anything that gave information on file types.

|Same model I have. No that is not normal. It should only give 2 icons.
|Do all 3 icons seem to work? If one don't, just remove that icon.
|I actually have both dual units in one machine and I get exactly 4 icons.

I though it wasn't normal. Now I need to find out why. If you ever
get to take one of the drives apart maybe you could note the position
of the jumper pins inside. There are three sets one of which is for
the ID's. The others are not mentioned in the manual which I traced
for these drives.

I've not managed to get the first icon to respond. The others respond
to slot 1 and 2 respectively. I could as you say just delete it.

|You referenced PCD-25BH, this is what I have exactly.
|The 3 slot units are part number PCD-47.
|The other set of jumpers are for a firmware update according to my manual.
|I recommend not messing with these, unless you know fully what you are
|doing. ;-)))

Yes you are correct.

I got my drives off eBay and they came without leads or a manual. I did
find a manual on line which is for both PCD-25 & 47. It only gave
basic information and nothing about these jumpers. I though they may
use a standard PCB for both models and differentiated by a jumper
setting. I'll leave these well alone and just put up the extra icon.

Message-ID: <pan.2006.02.26.22.28.25.935822@charter.net>
Source record: 9286

Hey guys. I'm having trouble with a Yamaha CDRW.

All I tried to do was swap it out with an existing (older - non working burner, but CD works fine) Plextor in my Atari setup that runs my BBS.

Its HDDriver v8.15 and ExtenDOS Pro v3.4. I set the Yamahas jumpers to the same as the Plextor, ID2, Parity, not terminated. I have a termination block on the end of the SCSI chain.

I tried this Yamaha on my CT60 Falcon and it works fine there, including burning CDs.

So what happens when I turn it on, hooked up to my Mega 4ST and the ICD Link2 is I get this:

HDDriver v8.15
copyright notice

Seagate HD specs
Yamaha CDRW specs

then 3 bombs. Always 3 bombs. I thought maybe ExtenDOS was doing something strange so I disabled it in the auto folder but it still does it.

Anyone have any thoughts, suggestions? Remember, this is a drive that works fine in my Falcon, and going into a setup that works fine with a Plextor CD.

Thanks much! :-)

6011. Yamaha 2100S followup

Newsgroup: comp.sys.atari.st
Date: 2006-02-27 01:17:05 UTC
From: "Ronald J. Hall" <dark_lord@charter.net>
Message-ID: <pan.2006.02.27.01.17.04.439738@charter.net>
Source record: 9288

Okay, I can confirm that HDDriver and this drive apparently do not get along on my Mega ST4.

I disabled everything in my AUTO folder, disabled all CPXs and ACCs, and HDDriver 3 bombs right after recognizing the drive. :-(

I've got an older version of HDDriver, v7.61, so I tried it - it doesn't crash, but you can't get anything to work either.

I tried both versions by booting from the original HDDriver floppy disks as well. Again, v8.15 3 bombs right after it recognizes the drive, and v7.61 gives some weird stuff on screen then exits out to a desktop that only has the A/B icons on it, no C icon for the HD.

Its so odd because this drive works with HDDriver on my CT60 Falcon.

I'll admit, I'm stumped right now.

In case it helps, here is my setup:

Atari Mega ST4 (TOS 1.4/Adspeed)
|
ICD The Link 2
|
Syquest EZ135 drive SCSI
|
Seagate 4 gig hard drive SCSI (external case)
|
Plextor CDR SCSI (same external case)
|
Termination block on back of same case (ends SCSI chain).

Keep in mind this setup works great. When I swap the Plextor out for the Yamaha, thats when the problems begin. But the Yamaha works great on my CT60 Falcon with both HDDriver and ExtenDOS Pro.

Thanks.

This is strange. Anyway, since Lonny has it working with the same
hardware I assume that the two of you will find out what's wrong by
comparing your hardware and software settings.

SCSI parity is not managed by ACSI-SCSI adaptors as I well remenber even for
ICD !

Remove the parity check on SCSI drives !

Hmm, I can try that - but I've always used SCSI on all my STs with Parity
on.

Keep in mind, the existing setup with a Plextor drive uses Parity on. So
does my Falcon setup. Further, that same Yamaha drive with Parity on
worked with my Falcon setup. I can even pull the CDR from my Falcon,
plug it into the Mega ST setup and other than changing termination, it
works fine.

I'm sure its just some odd little thing somewhere. Just don't know what.

I even went so far as to try this; I took my Mega ST - going to the ICD
Link2 - then straight to the Yamaha drive with nothing else. I booted up
from the original HDDriver v8.15 floppy. Guess what? Just as soon as it
recognizes the Yahama drive, 3 bombs.

I will try it with parity off though, and report back.

Thanks for the reply Rodolphe.

Ok so I have a 520ST and a Mega ST2. Some guy gave these to me years ago. Included was a hard drive for the ST but no cables or interface. I want to hook this HD up. It isn't an Atari made HD. What do you guys recommend? What is my best option? The ICD adSCSI or whatever it's called? Also, should I upgrade my OS? Just getting into all this as i've done strictly 8bits this whole time. I just have these ST's and figure I should do something with them. TIA.

Thomas

This just mean that ICD link is managing the parity ..
Was not possible on some other ACSI/SCSI interface like the one from atari
inside the MEGA STE.

I agree with Rudolphe. Disable parity. It's really not need on the ST.

I believe the other reason the Yamaha CDRW doesn't work with the MegaST4 and ICD Link 2 is because the Yamaha CDRWs use SCSI arbitration. Only the Link97 supports this. The Falcon and TT also support parity and SCSI arbitrarion. That's why it works on your Falcon.

You can do what I did. If you can find one, just get a Link II interface and
you will be able to connect the drive and get it running.

Actually that version you have is newer than mine. My version actually ran pretty darn good for me. But you must realize that Quick ST later became Warp 9 which made the ST ran a little bit faster.

Does any one know the what alterations (bug fixes?) have been made to the so
called SuperTOS 2.06 as compared with Standard TOS 2.06?
Also is there a source of info re the fitting of TOS 2.06 2 ROM set into a
STFM with 6 ROM chips?

Thanks in advance.

Upgrade your OS? To what?

Seriously though if the Hard Disk unit has a 19pin D connector on it
then you just need a DMA cable. If not then you need a SCSI interface -
good luck in finding one.

1. No. Apparently its not worth trying.
2. Yes. Ask Uncle Google. IIRC it involves plugging in the chips into two sockets (they will overhang) and then wiring in the addition pins to various places on the motherboard.

TOS 2.6 cannot work on ST, STF, MEGA ST, all atari with ROM space at $FC0000 to $FEFFFF (192KB).

TOS 2.6 on STE, MEGA STE, all machines with ROM space at $E00000 to $E3FFFF (256 KB).

To use a TOS 2.6 on ST machines, you have to decode the $E0xxxx addresses with a GAL....

I think I already told that several times here...and several years ago (in 1993) I was selling a chip named MODE2.6 to adecode and allow use of TOS 2.6 into STF & MEGA ST...

I have yet the JEDEC file...

Yes I use Gemulator all the time for all my correspondence and accounting work, including Income Tax, and plans are done with Gfa Draft. I have not found another emulator which does ST Writer, Marcel, and LDW Power, and Gfa Draft so smoothly and without any hesitation.

I use TOS 1.4 as well as TOS 2.6, downloaded from a web site. easier than taking them from my STFM.

It may be that other emulators such as STeem do games better, but I don't play games.

The version of HDDriver doesn't make a difference. Your host adapter
does not support the SCSI features that the Yamaha drive, and possibly
newer drives, require.

You need to use a Link97 at least.

The fact it works on the Falcon is because the Falcon supports SCSI2
natively.

Hi Simon. Thanks for the reply.

You just might be on to something there. I just double-checked the dates
on the 2 CDRs that I was playing with. The Plextor that works is dated
"March-2000". The Yamaha that does NOT work is dated "December-2000".

Could it be as close as that, just a few months? :-(

I've got ICDs Link2. Its handled everything I've thrown at it up till now.
As for upgrading to the Link97, they are no longer available commercially
right?

Okay, while testing some software I figured out that my CT60 Falcon is not holding the time/date. Its booting up somewhere in 1971. Worse, I can use Xcontrol to set the time and date and it won't even hold with the machine turned on! That is odd. I can see it changing between starts, but even while the machine is running?

Is a dead battery the most likely culprit? If so, whats the easiest way to add a new one. It doesn't look as easy as changing the batteries on my Mega ST4... :-)

Thanks.

in article 440221a1_2@mk-nntp-1.news.uk.worldonline.com, Mark Branson wrote
on 2/26/06 4:46 PM:

|> I though it wasn't normal. Now I need to find out why. If you ever
|> get to take one of the drives apart maybe you could note the position
|> of the jumper pins inside. There are three sets one of which is for
|> the ID's. The others are not mentioned in the manual which I traced
|> for these drives.

|I have a third unit laying here, bare mech. There is a plate with a screw.
|Under this plate is the terminators and the firmware jumpers. Assuming you
|terminated it correctly the jumpers under this plate should be ignored.

My Falcon/CT60 is in a tower case and I have terminator where the SCSI
chain comes out the back of the case so termination on the drive
hasn't been required. You've now identified the firmware jumpers which
I'll also leave well alone. That just leaves a third set but you'd
need to take the metal casing off to get to them. I'll try and take
mine appart this weekend.

|There is a hole near this plate which exposes the SCSI ID setting. I'm not
|sure how my settings here will help you. This drive is not in use and the
|ID is not even set. If your manual at least explains the one visible set of
|jumpers, then that is really all you need.

I'd worked out the ID settings, changing it from 1/2 to 5/6.

|> I've not managed to get the first icon to respond. The others respond
|> to slot 1 and 2 respectively. I could as you say just delete it.

|I'd remove all 3 icons, then force the desktop to reinstall them. Maybe the
|extra icon is unrelated or it got there some other way? If all 3 icons
|reappear, something is for sure working strangely. At least with most
|desktops, once you have saved the desktop arrange, all the icons will reload
|the same way on every boot up. Meaning, if you swap the drive, do not
|expect the extra icon to just vanish, you probably have to manually remove
|it. I don't use magic, so my statements are based on my MiNT setup.

I've done some reorganising when I added a 10Gb drive and then later
repartitioned my original 2.1Gb drive down from 6 partitions to 3. I
also swapped over my card readers. Each time it came back with three
icons even after deleting them. On the software side I upgraded from
MagiC 6.01 to 6.2 and HDDriver 8.04 to 8.16.

|>The camera is a Canon IXUS 50 and came with it's own 16Mb card. I
|>later bought a SanDisk 512Mb Ultra II card. Both act the same.

|>Unfortunately the manual for the camera is in French. I couldn't see
|>anything that gave information on file types.

|I went to the Canon site and obtained the manual in English. It infers the
|SD card from the camera is readable on a PC or MAC simply via a "card
|reader" and an adapter may be required. So in theory it should work and one
|can assume it is stored in some standard format if these OS's can read it.

Thanks for the manual. Looks like I've got a lot of printing to do!
I'm less worried about the three icons more about why the card isn't
recognised. I'll have to recheck my system to see if I've got anything
set up wrong.

sinclap@yahoo.com wrote:
> Nice try! So why do you need to run another OS if the included
> standard one was suppose to do all?

Please tell me who said TOS/GEM was supposed to do all, and *quote* the post. You don't still run the original Mac System 7, do you - I mean wasn't System 7 supposed do all? Of course not! But that's exactly what your question is asking! I won't run an OS that's 15-20 years old when I can run one that was updated as early as this month (aka "modern")!

I don't think of the built-in TOS/GEM as the real OS, except when the rare old game or demo needs it. Similar to the concept that MacOS X uses, actually. Why do you need MacOS 9 installed in addition to MacOS X? To run old stuff that OS X won't.

Personally, I very much like the fact that TOS/GEM is built into the ROMs, over which I can run a variety of other OS's to fit my tastes (Magic, Mint with all it's various AES's, and even Linux). And then when the occasional problem does occur, I can still get a workable GUI, access the Hard Drive to correct the problem, and I'm instantly up and running. Try that on your Mac!

On my Mac, when I've run into problems I've had to stare at a sad face on the little 1980's Mac symbol you see at bootup, while trying to find where I put those darn system restore CD's, reboot from the CD, reinstall the entire OS, get all my data and more recently updated software back into place... Huge pain in the butt! When similar events occured on my Falcon, I rebooted while holding down the Control key, which instantly gave me a usable GUI, removed or replaced the problem program, and I'm instantly up and running. When I did have to reinstall the more modern OS, it was very quick and didn't replace all of my updated software - only the core OS files. Much easier, much smoother.

From: phantomm <phantomm@bellsouth.net>
Message-ID: <Ak7Nf.52390$bW.29529@bignews8.bellsouth.net>
Source record: 9219

Greetings,

I have an Atari STacy, but do not have a manual for it.

I need to know what kind of internal Hard Drive was used in these,
and there size (2.5), (3.5)?

I'm hoping that a larger hard drive can be installed on the inside.

Also, I notice a space under the internal disk drive, Can this space be
used to install another drive or something or is the space under the disk
drive full of hardware?

Also, anyone happen to have a English STacy manual that they don't need?

And, I suppose the STacys have TOS 1.04. If so, how many chips make up
TOS 1.04 in the STacy and can TOS be upgraded to 1.62 or 2.06?

If so, would this be the same type of upgrade as for a Mega ST or 1040ST?

I do not think CT60 effects the clock, you need a program to clear the
NVram, There are plenty around in the PD, you could try a search though
floppyshops utils there will be loads of programs in there... I do not know
of any utils offhand, didn't CT60 have a option somewhere to clear NVram ?
Not saying it is that but worth a try... maybe rodolphe could help you
better with that...

So, the ST can't do all. Need to rely on other OS platforms to be
productive and creative.

Never gotten a sad mac before. You need to move on from the 80's
experience when computers of all types had crashing issues. I knew
some who had ST's that took months for warranty repairs.

Source record: 9224

There is CBOOT to clear and set the NVRAM.
CBOOT is inside the CT2.ZIP package on my web site.

But the Time/date function cannot be corrupted by software ...
software can corrupt NVRAM...but the RTC is independent...
The test is simple : Put the correct time & date....turn OFF....
Wait for 1 minute at least...
Turn ON....if the date/time is stupid, the battery is dead...

Nothing to say more !

Now you can remove it (unsolder) and solder a new one for 10 more years ...

Buy it for 11 $ at BEST Electronics (San Jose CA) !

So simple too..

Regards

Really? My Falcon always looses its time after shutdown, ok so the
battery is broken, no problem.

BUT: when i correct the time and date via the control panel and run an
app it is fine, but it gets corruppted again when I return to the
desktop WITHOUT shutting the Falcon off. Is there a solution?

Why are you talking about productive and creative? You're neither, only disruptive and destructive. Your mother should have taken *you* back for warranty repair. How many months of electroshock treatment will it take to straighten *you* out?

This March I'm celebrating my Birthday! If you want to bless me, I'm
trying to raise Capital to buyout an Atari Dealer of all his Atari goods!
So give me your Atari business, send all Atarians Marching my way and help
save Atari goods from extinction, buying from Ben Saves Atari!

I'm creating a NEW Atari catalog. Catalog's name is NEWINBOX.TXT compiled
from all items NEW in BOX from all my other catalogs made up of Hardware,
Games/Software and Books for the 8 Bit, ST & Jaguar! Instead of 38 columns
of text width it will be 80 column width, Most entries will be 1 line each
and sorted alphabetically by title. You'll only find my NEW items in this
catalog as I'm removing such NEW item's from their other catalogs.

http://BensCatalogs.Atari.org Atari's for sale!
http://www.aracnet.com/~atari/adoption.htm Atari Adoption Agency!
http://www.aracnet.com/~atari/birthday.htm Ben's Atari Birthday!
http://www.aracnet.com/~atari/wantlist.htm What Ben Wants!

I've got a fast turnaround rate. Usually, Once I receive payment your
order goes out the same day. Customers love the speedy service! I have
lots of Atari SoftWare & Books. Which I can send by Media Mail Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or
Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/
Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at
http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received
Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify
Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

If I am not mistaken, there are a couple of good NVRAM programs that come
with
the CT2B Software. I know I have used them alot in the past.

Not sure if there for non CT2B Falcons or not.

But there are very good.

Hey Folks,

Just for the record, Where is the Falcons Battery located at on the
motherboard?

And is it just a battery or part of another chip?

I thought that the battery and NVRAM was made together. Or it was part of
another chip. I must be wrong??

Also, Ron if you are reading this and need a battery, I may be able to
supply you with one.
I have a Falcon mother board for parts that has just about everything on it.

You may want to try and get a new one if possible and not to expensive.

6068. Re: sound capture on Mega STE

Newsgroup: comp.sys.atari.st
Date: 2006-03-03 21:55:26 UTC
From: phantomm <phantomm@bellsouth.net>
Message-ID: <yU2Of.479$c76.466@bignews4.bellsouth.net>
Source record: 9245

I think it is possible, since the MSTE is 16mHz.

This is a project that I have looked at myself.
I wanted to create a way to transfer small speech/sound recordings
from the Falcon or other Atari to another Atari while both are connect to
the net.

So that one could really talk to one another.

After getting this done, then one could maybe add some pictures or maybe
video
using the VideoMaster Falcon or VideoMaster ST cartridge.
(Really a program to transfer sound and maybe video too could be done based
on
the VideoMaster cartridge since it does both Sound and Video.)

I don't see why this hasn't been done by someone already.
I know it would work with Falcons. And should work with Ataris with
good cartridge based sound digitisers.

If you are just want to basically do Direct to Disk recording on a MSTE. I
think it is
possible. If I am not mistaken, there was a program on a ST Format Cover
disk that did
this using some type of Cartridge based Sound Digitiser.

By all means create anything that you can in this area, as not much has been
done yet.

Thanks for the offer Barry. I'll probably go with Brad at Best
Electronics. A brand new one there is only $11.95 so thats okay.

:-)

Hmmm...I know that area, I think the NVRam is around there as well.
Would have to pull out the mother board to make sure. Of course
the NVRam needs a battery to keep it's settings. That's why I thought
that both were in the same chip.
I'm going to have to order a Falcon Field Service Manual.

Well from the price that you are getting it for, I would think a NVRam chip
would cost more.
Then again it depends on the supply. Not sure how long that Battery is
suppose to last, but I'd
bet that a few more Falcons could use a new one.

- - - - -
Right. You just need to set the clock at startup.

That said, has anyone been able to contact Alex at ATY computers
lately? I sent him an email, but he didn't respond. I solder a bit,
but would prefer if more talented hands changed my backup Falcon's dead
battery. Rodolphe did the job for my CT60'd Falcon, but shipping to
France is a bit costly.

What I do now is a link between the TT and Mega STE:
- the TT captures the images with Vidi ST 12
- the Mega STE captures the sound with the ST Replay (only in RAM!)
- a seriel link to synchronize everything.

As I have upgraded the TT Ram, now I can take a lot of frames on the TT,
so I would like to take loger sounds on the Mega STE...

Guillaume.

Yes, the computer continued to operate normally, booting up, everything.

The only reason I noticed it at all was I'm helping beta test for Roger Burrows of Anodyne Software right now, and the beta releases are "timed". My system clock date is defaulting to 1971? (where does that date come from???), and the beta software won't run with that date. So I can open up Xcontrol, set the date to current, and the software then runs.

Now I've got another question. Rodolphe and Galen here, both mention just setting the clock during bootup or while its on and it stays set until the next time you powerup. Well, I can set the clock, and literally without powering off or resetting, I have to set the clock again in just a few minutes. This sounds like something else.

Any ideas? I believe Rodolphe mentioned a bad CPX or something...

>Also is there a source of info re the fitting of TOS 2.06 2 ROM set into a
>STFM with 6 ROM chips?

It is a bit complicated- TOS 2.06 is 256KB in size and can not be simply
put instead of earlier TOS-es that were 192KB in size: there is not anough
address spaces at locations to which these chip socket are wired
(TOS 2.06 uses a different starting address). A usual solution is to
install (above the CPU) a small additional card with an address decoder
and two EPROMs for the new TOS. A bonus is that this can be made switchable,
i.e. you can select either the old or the new TOS.

There is a possibility to put the EPROMs into the existing sockets,
but an address decoder must be installed in all cases, and some additional
wiring must be connected. The decoder can be made from about 2-3 standard
TTL LS chips or some programmable logic.

Instructions can be found on the net.

>
> This I don't know.

The battery is inside the NVRAM chip.

Replacing the NVRAM chip requires soldering skills (natch), but
apparently a repair can be made by carefully removing the top of the
NVRAM chip, removing the original battery found within, and bringing
out the leads to an external CR3032 button cell/holder.

At your own risk of course, but this might be an easier repair to make
than taking the motherboard out to desolder the old NVRAM etc.

This means that you are not booting from the HD already?

I can't remember whether the ST's boot sequence checks both A and B for
a bootable disk. Anyway, once you have a working external drive, you
can put your megafile driver disk in the external drive, wait for the
desktop to appear, and then run the installation program to make your
drive bootable.

> Also will the Megafile HD work with a 520ST, in case I need to replace the
> 1040.

Yes, but you won't need to replace the whole computer, it's almost
guaranteed that only the floppy has failed. Can you clarify whether you
have 520ST, 520STF, 520STFM, or 520STe? They are virtually the same
except the F has an internal rather than external floppy drive (which
you could remove and place in your 1040), the FM has internal floppy
and modulator (to hook up to your TV) and the 'e' has both, but has
redesigned internals.

Do a google search. You can usually get a PC floppy to fit with a little tweaking of the case and the drive.

Ah yes, I remember these now. There is also a modification one can do
to the motherboard, I did it about 15 years ago to my STe, which was to
cut the two pins of the soundchip that control the drive a/b select and
wire them to a toggle switch, IIRC!

> Do a google search. You can usually get a PC floppy to fit with a little
> tweaking of the case and the drive.

Yes, physically, but not logically. You have to change the DS jumper on
the drive because PC floppy drives are preset to drive B, which is then
reverted to drive A with the twist in the PC's floppy cable. The ST's
cable is straight through, so the drive needs to be set to drive A.
Most modern floppy drives dont have this jumper anymore, but I recently
modded a couple of Sony MPF920's which do have a solder link. I assume
that these mods are above the abilities of the OP though...

Coda.

> codes were due to things which was needed to squeeze more power/colors etc
> from ST...

Well, yes and no.

Most games from the early days of the ST failed to be compatible with
anything simply because people were beeing dumb:
- assuming all machines have 512k of ram, and puting arbitrarily the adress
of screen in some area that will get trashed.
- reading directly some undocumented system values in order to detect the
position of the mouse or joysticks, that of course will have
changed/disapear on the next revision of the tos
- using shadow registers of the ym
- writing read/values in non mapped adresses
etc
etc

If you put aside things that are obviously working only on the 8mhz-cache
less-ST range of machines, like sync-scrolling/overscan, there are very few
cases of code optimisation that would fail on other machines.

So that a game runs to fast or to slow is ok, but crashing is generaly due
to "assumption based" coding practices.

Hello

Maybe some of you who also use Dayna SCSI/Ethernet Interface and got some experiences can help me to setup my TT.

My situation is like this. TT is connected to LAN which is connected to Internet via ROUTER (10.0.0.2), subnet mask is 255.0.0.0.

I use latest software (STING 1.26 with TCP 1.40 and SCSI/Link 0.71)
At startup STING properly communicates that SCSI/Ethernet is connected.

Doni¿½t know what im doing wrong but I cant get TT to be visible even in LAN nor reach Ethernet.

So anybody who can tell something, how properly ROUTE.TAB should looks?

Pawel Kaznowski

(sorry for my shitty english, I hope youll understand what im writing about :)

Hello,

Some people told me Doom was very slow on CT60 compared to the CT2.
The reason is that Doom (and Heretic and Hexen) use divsl and mulsl
instructions for 32x32 multiply and 64:32 division. And these operations
are emulated on 060.

So I took FPU routines present in Amiga Doom versions, and now, it runs 2x
faster (on 060 machines).

The new version if available on my website.

Coda and David Wade

The 520 is a 520ST, so it doesn't have an internal floppy drive. So I guess I'll buy it, just for the external FD. It sounds like I should stay away from PC drives because of the complexity.

With the 520ST the external drive is drive A (just in case you didnt know). You could plug this into your 1040, it will become drive B, or you can take it out of its case and use it to replace the dead drive in the 1040. One question though, is the external drive an SF314 or SF354? The SF354 is only single sided...

Coda.

Tested it now, and I must say this is the most stable pm-doom release
in quite a while.
The only remaining glitch I can notice, is that the sound is
occasionally slightly distorted when several samples are playing
simultanously.

Keep up the good work :)

Regards,

/Joakim

Hello,

I have bought a NOVA graphic card (ET 4000+VME adaptator) but without
the drivers. I have used the drivers from another NOVA I already have.

But, nothing works! The desktop appears but you can see 3 or 4 times the
image being repeated in the width and using half of the height.

I changed the monitor: nothing (black) on the other.

Could it be a problem with the drivers?
Has anyone them?

Guillaume.

What version drivers do you have? Not all Nova cards are ET4000's, mine
is in fact an ATI. Maybe this is the problem. IIRC when you do the
install it asks you which type of card you have. Did you just copy the
installation from your AUTO folder?

Some Nova's are in fact ET4000, a fact I didn't know until recently. And
yes the ET4000 drivers likely won't work with the ATI card or vice versa
;) Additionally the Nova needs separate GAL's depending on whether it's
installed into MSTe or TT and as well depending on the VRAM of the card.
(Though the higher VRAM card will probably work with less vram addressable).

Thanks,
Mark

My Nova card (well actually the VME to ISA bridge thingy with the GAL
on it), has a jumper saying MSTE/TT. I didn't try this card in my MSTE
before I sold it though...

On Sat, 04 Mar 2006 15:09:22 -0500, Ronald J. Hall wrote:

> Any ideas? I believe Rodolphe mentioned a bad CPX or something...

Okay, I've been playing around with my Falcon (isn't that what they are for? <grin>), and found out something else interesting regarding the battery/clock situation.

I boot up, Xcontrol shows a date of "15/31/07" which all software reads as "1971".

I can set the date to current, leave the machine, come back, even hours later, and the date is still correct. Until I reboot. Then its "15/31/07" again.

This seems to me to be consistent with a battery thats dead.

Now the strange part. With it booted up, Xcontrol set to the current date, I can run *any* program, exit the program, and the Xcontrol date is set back to "15/31/07".

Is this normal behavior for a dead Falcon battery? I'm just trying to make sure that I don't have any other problems.

I did as Rodolphe suggested, I setup a clean boot with only Xcontrol enabled, no ACCs or other CPXs at all, and it still exhibits this same behavior.

Thanks everyone.

Oh yeah.. So the GAL change is only to from Nova to SuperNova or
something like that. Guess it should work then.

Thanks,
Mark

6112. Cubase 3.01 on a TT

Newsgroup: comp.sys.atari.st
Date: 2006-03-07 12:20:53 UTC
From: ausl8 <mc205athotmail.com>
Message-ID: <440d7acd@news.eftel.com>
Source record: 9339

Can any one tell me if it is possible to run Cubase 3.01 with dongle on a TT. (I have seen cracked versions running) 3.01 with dongle runs fine on a MEGA ST but when launching on my TT it complains 'no key goodbye'. So I'm thinking there could be a cartridge port problem with the TT or else its the wrong dongle? I have tried cleaning the cartridge port contacts with no succes. I have looked on the www and old news group postings but have not found a definitive answer for this.

Thanks in advance.

Hi, <???>!

a> So I'm thinking there could be a cartridge port problem with the TT or
a> else its the wrong dongle? I have tried cleaning the cartridge port
a> contacts with no succes.

This won't help you, but I'd suspect the TT's higher system bus clock
speed to cause problems with the dongle. Maybe the dongle has been
designed with timings suitable only for 8 MHz system clock.

I know about ROM-Port-cartridges with that kind of trouble if plugged in
Falcons.

I wish you that I'm wrong with my dongle-clockspeed-suspection!

Regards,

Alexander

Yeah, and old PC. You have to remove the twist between the second and third connectors though or you can just cut the twisted bit off after the second connector.

It will if you hold down the ALT key (IIRC) after you start it. This
will disable the audio engine.

wow!!!!!!!!!!!!!!!!!!!honest advice ,i'll take that open hearted-lly..
awesome.!!!

now if i could only use a program that allows me to activate all 6 versions
at once . i would be beat master.
imagine all 6 cubase running multiplly at the same time!!
manned by one controller!!!! all externally sync'ed and on the same
computer....
lets see.....hhmmmm??...version 1 controlling the cubase score version,
version 2 sync'ed from version one controlling phrase synth in version three
.audio falcon recording output with the tt as the master..HA! just kidding
this is not possible,but for those of you who "wadlled through this
crap".try running multiple versions of steem on your xp and sending midi to
each running model of steem ..
i'm talking real time recordings of constant malipulations.
steem1 to steem 2 to steem 3....etc,etc,etc. this is no lie!!

works for me .

Hi,

Packages that I maintain have been updated according to the
release of the 0.9.3beta version of ARAnyM.

It concerns the followings :

- The <http://eureka.atari.org/xa-my-aes.zip> versatile
boot disk image compatible with AFROS allowing usage of
TOS4.04/EmuTOS and freeMiNT + XaAES or MyAeS.

- The minimum pack <http://eureka.atari.org/pack_aranym.zip>
that is built for Linux.

- The minimum pack <http://eureka.atari.org/MacAranym.zip>
that is built for MacOSX.

Enjoy :)

Or even leave the twist so that when the ST floppy dies, you can just
plug a new PC floppy in without having to mess about trying to adjust
the sometimes non-existent jumpers.

Sorry David, that wont work. The twist and the jumper are two different
ways to change the drive and they are not the same. I have tried it
myself many years ago on an ST and I got strange errors.

I have some info for you that may help and is quite interesting,

In ST Format Issue 60, There is a program called SAM2DISK, Which is
suppose to allow D2D (Direct to Disk) recording (Hard Drive) on any ST,
using a sampler such as Stereo Replay, Replay 16, Master Sound, Stereo
Master.

The version on the cover disk is fully working except for the save feature
of the sequencer
section disabled. (I believe you can still record to the hard drive
though).

When registered you were suppose to get a few other useful programs.

Does anyone have the full registered version of this program!???
If so, do contact me.

The registration address was listed to be in England and cost 35.99 Pounds!!
Back in 1994!

I have the Cover Disk with the Working Demo of SAM2DISK and remember running
it on a
1040STE, but didin't have a sampler at the time to check it out.

This is the only program I know of that claims to allow Direct to Disk
recording on a ST!
Maybe there are a few more, if so I would like to know about them.

Guillaume, if you don't have the cover disk, you maybe able to download it
from the net.
There is a site that has most of ST Format Cover Disks, I forget the URL at
the moment.

Google for ST Format Cover Disks, or Atari Magazines and you should find it.

If you can't find it on a FTP site or Web Site then let me know and I'll
extract it off the
Cover Disk and E-Mail it to you if you want it.

If it is a SCSI zip drive then you need a SCSI interface and a SCSI driver like HDDriver. If it isnt then you wont be able to use it.

> How hard is it to increase memory, and how much can be added?

Depends on the model of ST and the board revision. Some STFM's have empty positions for the DRAMS (you need to solder them in plus 1 capacitor for each DRAM and add 3 resistors). The STe uses either SIMMs or SIPPS. If SIMMS, then just click them into place, if SIPPS then you will solder them in. Other ST's are a bugger to upgrade and need a RAM expansion board, and lots of soldering.

What I'm looking for is a stable version of Cubase running on my TT. My
experience with cracked versions is that it can be unpredictable / unstable.
I was hopping the dongled version would be better or perhaps there would be
no difference?

Hi!

Only dongled Cubase will work all the time.

Cubase 3.01, Audio and Score (3.05 with Score - I think itďż˝s called
Cubase Score 2) should run fine on the Atari TT030.

Best Regards,

Daniel Mandic

....but getting back to the original point which was:- I have a Cubase ver 3.01 dongle which works on a Mega ST but it will not work on my TT. So if you are correct that 3.01 will run (cracked versions do) and there is not a specific TT dongle then it appears my TT cartridge port is suspect? I'll try cleaning it again.

Thanks for all the replies!

It's possible that its tarnished yes. If cleaning doesn't work the fuse
that supplies power to the port may have blown. You will need to have a
soldering iron to fix that problem though.

Hmmm, I am not sure if 3.01 is 3.1. On the IBM-PC it is 3.05 (that I know), the last version, then came VST.... 3.5, 3.6, 3.7 and so on.

I would suggest that you contact a Cubase Atari expert. It is not understandable for me, why the 3.01 crack works and the 3.01 Orig. not.

Dongel Contacts you have looked, I donďż˝t know more.

Try it on a 16/32bit (ST) Atari!

Best Regards,

Daniel Mandic

i am your "atari cubase expert" it will work ,a sure fire method is to try
dongle and program on a st ...i have the manual ..title page states
....cubase ....for the st ste and tt
.......so try on regular st .

i really hope that you can't control the flow of information out your dongle
port because if you are able and have had a misdirect, i'm afraid ,the
information exchanged may
have defected the dongle .

well you can always sell on ebay ,or you can always buy on ebay.

charles

This March I'm celebrating my Birthday! If you want to bless me, I'm trying to raise Capital to buyout an Atari Dealer of all his Atari goods! So give me your Atari business, send all Atarians Marching my way and help save Atari goods from extinction, buying from Ben Saves Atari!

I'm creating a NEW Atari catalog. Catalog's name is NEWINBOX.TXT compiled from all items NEW in BOX from all my other catalogs made up of Hardware, Games/Software and Books for the 8 Bit, ST & Jaguar! Instead of 38 columns of text width it will be 80 column width, Most entries will be 1 line each and sorted alphabetically by title. You'll only find my NEW items in this catalog as I'm removing such NEW item's from their other catalogs.

http://BensCatalogs.Atari.org Atari's for sale!
http://www.aracnet.com/~atari/adoption.htm Atari Adoption Agency!
http://www.aracnet.com/~atari/birthday.htm Ben's Atari Birthday!
http://www.aracnet.com/~atari/wantlist.htm What Ben Wants!

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. Customers love the speedy service! I have lots of Atari SoftWare & Books. Which I can send by Media Mail Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/ Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

Source record: 9143

Hi Guillaume,

GT>I have bought a NOVA graphic card (ET 4000+VME adaptator) but without
GT>the drivers. I have used the drivers from another NOVA I already have.
if it's really a ET-4000 card, you should use NVDI drivers. From a
certain version (4.x?) on, NVDI was all the same for native VDI or
graphic cards.

When using the VME adaptor soft, be very very careful when changing
the parameters, for you may destroy your screen very rapidly. So
please be sure to know whar you are going to do. I had a TV technician
at my right side when I configured the drivers for some reasonable
resolutions (e.g. 1024*768/256 or True Color etc.)

Good luck!

> faster (on 060 machines).

hm, am I alone with 100 MHz, boosted data bus Falcon060 with the
problem that doom is AWFULLY slow? I remember the speed of 0.2x
versions, it was playable even on ct2 with nearly full window... and
now, on ct60, it gives me maybe 8 fps?

It's normal? I noticed this rapid speed decrease after switching to
SDL...

I just want to congratulate Patrice on such a great job. I just tested .46 of PMDoom on my CT60 Falcon (95mhz/256 megs SDRAM), using the DOOM 2 wad and it works great. Sheer speed is the single biggest improvement here. Sound is better, and somehow, even the graphics seem a little sharper. Now to go back and try the original DOOM 1 wad.

PS BTW, I've got my Falcon setup where I can do RGB stuff as well. If I run PMDoom in RGB mode, will there be another performance gain?

PSS Patrice, any chance we'll see the code optimizations from this latest PMDoom release in your versions of Hexen and Heretic? I always liked Heretic.

Thank you very much! :-)

The speed gain would be against the different video frequency, and bus
usage by Videl to draw stuff.

> PSS Patrice, any chance we'll see the code optimizations from this latest

> Heretic.

Of course, I'm just rewriting the audio mixing routine, testing it in Doom
before merging in Heretic and Hexen.

>Pawel Kaznowski
>
>(sorry for my shitty english, I hope youll understand what im writing about

I know that if the route.tab file is not correct, then you will not be able to
do anything as far as Ethernet is concerned. When you edit this file, it is
very important not to mess up the spacing. Here is what mine looks like:

0.0.0.0 0.0.0.0 EtherNet 192.168.1.1

192.168.1.1 255.255.255.0 EtherNet 0.0.0.0

I am also using STING 1.26 and my computer is the 1040STe.

Hello,

Just for fun, I'd like to create a little net linking my Mega STE and TT.
What soft exists? What speed can I expect? What cable?

Tanks...

Guillaume.

Itï¿½s a new year which means a new CCAG Show!

Buy, sell, trade, play, and see classic video games, computers, peripherals, memorabilia, and more at the Classic Computing and Gaming Show (CCAG) on May 27, 2006 (and again in October, 2006) at the National Guard Armory, 3520 Grove Ave. Lorain, Ohio from 5:00 PM - 9:00 PM. Vendors, clubs, and collectors will be displaying and selling their retrogaming and retrocomputing goods, from Pong and Atari to Nintendo, Apple and IBM to Commodore and everything in between with many set up for you to play with and explore. We have 5000+ square feet of space. Help us fill it all up!

For more information please go to http://www.ccagshow.com/

Best lowcost solution is Plip. I had that from 98 till 2004 or so. TT had riebl ethernet card and acting as server and IP masquarading machine, while Falcon was my main machine and accesing internet via TT... Speeds were up to 120 kbytes/s... Bad side of Plip is that afaik it require MiNT, so it is memory hungry solution... Good point is, that u only need modified parallel cable and that it is full working network... u can install ftp/www/nfs etc servers and play with little "home" internet, or via TT acces the real one from TT and Mste

But if u dont need speed and not have a lot of RAM (esp on Mste) try midi net or serial....

>Just for fun, I'd like to create a little net linking my Mega STE and TT.

>What soft exists?

I would recommend using standard network software:
STiNG seems a good choice for that.
Once the network is on, you can use a FTP and a web server, as well as
clients, of course, to communicate between the two machines.

>What speed can I expect?

The best reliable speed you can get on the Mega STE is 115200. You *can*
use 230400, but in my experience the resulting speed is actually slower.

>What cable?

It's a standard serial cable.

Another solution, more expensive, would be to use two network cards (one
on each machine).
In this case, the speed is of course much faster.

Is that on modem 1?

Thanks!

6170. What is the largest newest monitor I can hook my STe up to?

Newsgroup: comp.sys.atari.st
Date: 2006-03-12 01:13:22 UTC
From: STcomp@cwo.com
Message-ID: <1142126002.208007.184400@p10g2000cwp.googlegroups.com>
Source record: 9147

I am getting older, and my eyesight ain't quite what it was. The SC1224 screen is killing me. Does anyone know where I can get a color monitor that is large, and will hook up to an STe? I like to use a real ST, emulators on my PC will not do.

I do have an adaptor for my STe that I have used to hook up to an ancient Everex monitor from 1989, and also an old NEC Multisynch from the same time period. The adaptor I have is the very commonly talked about one that a lot of ST users know about from way back when, nothing quirky or anything. (I have one adaptor that will make the monitor display color, and one for displaying MONO mode on a color monitor, I built them from plans I downloaded on a BBS about 15 years ago) It has the round din for the back of the ST and then the trapezoidal...how ever many pins it was, standard monitor plug of the day.

But what about newer, larger monitors from the 90's and up, any hope for an ST to hook up to one? Will the old adaptors I have for the NEC work, or is there maybe a newer monitor adaptor that would go from an ST to a newer color monitor? Just wondering, hope it isn't a dumb question, but it seems like any time I tried any monitor besides my old Everex or NEC it was no luck. Probably wrong HZ rate or something.

My understanding is that using an adapter like you have, you should be
able to get ST "high" rez out of just about any stock VGA/SVGA monitor.

Now color, thats another story. The monitor in question has to be able to
sync down to 15k. If it can't, it won't display it. Most newer style VGA
and SVGA monitors no longer support this range.

One route you can take is to try and pick up a good multisync monitor from
someplace like Ebay. This is what I did. I found a solid/working NEC 3D
which supports just about everything my Falcon needs for both RGB and VGA.

Another route you can take is to try and spec out one of the modern LCD
TVs, that support multiple input sources, and sync down to that magic 15k
level. The thing is, most of them are pretty darned expensive. If I hadn't
found the NEC 3D, this is what I probably would have done.

I suppose you've already thought about it, because there isn't a huge
difference, but the Atari SC1435 monitor is bigger than the SC1224, and
plugs straight up to any ST/STe. It even has stereo speakers to support
the STe. Some people don't think the picture is quite as sharp as the
SC1224, but opinions vary on that.

Hope this helps ya some... :-)

If so, there must be different revisions of the serial components on
MegaSTe's. I saw information on the net a long time ago that reliable
connections are impossible beyond 56k, and my own testing at that time
beared that out. My research told me that the SCC chips in the TT and
STe were a different revision (IIRC I think it was buffer size).

True, I have done this myself, but I got a vertically squashed picture.
If its a good monitor it will resize this itself properly, mine didn't
I had to go in the back with a screwdriver (not recommended!).

These are great if you can find em. Still small though.

This may be the best option, because you can try the ANT socket for
easy hookup but not the best quality, or if there is RBG or Composite
inputs you can make a cable for what should be a great picture. The
price of these TV's are coming down rapidly though, but I would check
the specs before buying any LCD TV, there are a lot of rubbish ones
around!

BTW, have you considered buying an LCD or DLP projector? You could have
a 20ft screen! ;-)

Coda.

No, Modem 1 on the Mega STE is the same as on the ST/STE, max. 19200.
It is there mostly for compatibility reasons.
The fast speeds can be achieved on Serial 2 and Modem 2 (and Lan, which
is more or less the same as Serial 2 internally: both cannot be used at
the same time).

They might but, as far as I know, all Mega STEs can achieve 230400 on
Serial 2/Modem 2.

>I saw information on the net a long time ago that reliable
>connections are impossible beyond 56k, and my own testing at that time
>beared that out.

I think you refer to something else, which is a hardware bug on serial
ports of the Mega STE. (Since it is a hardware bug, it cannot be corrected
by HS Modem.)

Where this bug is present, data going through Serial 2 or Modem 2 may be
corrupted as soon as the speed is higher than 19200.

This hardware bug is rather clearly documented in the SCC_X.TXT in the
HSMODEM documentation:
MegaSTE with MODEM2/SERIAL2 Errors

With some MegaSTE's, during data transmission over MODEM2 or SERIAL2 and
simultaneous DMA access of the hard drive or floppy disks, files are
destroyed. This usually shows up when, after using - say - ZMODEM for
receiving (or sending) archives (e.g. LZH, ZOO, ZIP) they can't be
unpacked (error message from the packer). This error is caused by a faulty
PAL in the control logic of the SCC. Franz Sirl has developed a GAL that
replaces the PAL and in our experience removes the error. The listing for
the GAL can be found in mailboxes as archive FSER096B.LZH.

I have indeed the corrected GAL.
With it, I can use reliably 115200.

Some only have composite inputs, and if you want good colour you will need
RGB. Remember all SCART inputs are born equal. However you should be able to
get a panel that does both Atari MONO and "Normal" but it would be good to
try first. Perhaps get one from some where that allows return with no
question before 28 days are up...

Jackpot! Same behaviour as mine on the Falcon! Even without Xcontrol,
the date and in my case the clock get corrupted that way!

I wouldn't mind about a dead RTC, had to set clock and date by hand on
my ST as well but I'd like to have a stable clock/date while power is on.

So I guess it is common behavior for a Falcon with a dead battery? I think
thats odd though. I mean any ST class machine will still hold the
date/time even though a battery is dead or it doesn't have one. Could it
be because of the NVRAM?

Im using TVGA TV tuner (Aver media JoyTV) and its not that bad actualy. I
do use composite though. Thing with composite is to use good cable, but
only rare devices has quality internal wiring... Not as good as RGB but
also not bad, and u can connect many older machines etc there as well...

It's probably just that particular design of RTC. With a dead battery
across its power terminals it cant function properly. Other designs
seem to be OK in this scenario.

Just a hypothetical question... If someone bought the plans to the
phenix and started manufacturing and selling them on a large scale,
would they have the legal right to all the profits and also brand them
as their own product?

6189. Re: EBAY : Manufacturing folders with PCB FILMS of Phenix 060, CT2b and Phenix Alpine board

Forget this idea...!
The PCB of the Phenix 060 contains several bugs that were corrected with
wires and solders...;-)
And secondly the technology on Phenix 060 is old....
No sense to produce that !

And the better here...There is no completer schematics existing about the
Phenix mb !
Juste some parts for each chips that a guy already bought on a previous
auction..
The rest was into my head... and is erased now... because it was no sense to
keep such data in my head (need place ;-)).

Again these auctions are for collectors atari, not to produce...
The only thing you can produce is the same Phenix MB prototype with same
problems and same bugs...

Hi,

The first beta of zTask is now available on my homepage.

zTask is (yet) a taskbar program that allows you to control your
running applications.

Before to report the problems, look if your computer meets the system's
requirement.

Ciao,
Zorro

http://zorro.arcadia-crew.com/

That's interesting. How is your program different from Taskbar, xTask, Appline, etc., other than the ability to list CPU usage? Are there other things you're intending for this program that aren't in it yet? Could you have the program check for which OS it is run on and disable the functions that don't work when run on Magic? Just curious. I just can't seem get a system I'm happy with or that runs well when using Mint, so I use Magic as my main system and only use Mint when I absolutely have to. I like the appearance of this taskbar better than the others, but it doesn't run on the OS I like to use. A workaround of some kind might be nice, if you're willing. And I understand if you're not.

I wrote about this a while ago. (Search under my "name" on
groups.google.com.) In short:

10.0.0.0 tab tab 255.255.255.0 tab tab EtherNet tab tab 10.0.0.2

should be all you need unless your TT needs to send packets for other
computers out another port.

My Falcon interprets 15/31/07 as 2107! Try changing XControl right after bootup. Then exit XControl and reenter it immediately.

When my Falcon's battery started to die, it simply needed setting. Now I get the same thing you do.

I don't think that just having a copy of the design and PCB artwork would
give you the legal rights of ownership to the item, I assume the rights
would still belong to the original developer and so you would need some form
of communication from them stating that they are giving you full ownership
of the project and all associated rights or some other form of permission to
manufacture and sell the item if you were to legally manufacture/develope
the item and retain any profits made from it let alone re-brand it without
the risk of being sued, but thats just my opinion.

Hi,

mail@freeman-studio.com a ï¿½crit :

> That's interesting. How is your program different from Taskbar, xTask,
> Appline, etc., other than the ability to list CPU usage?

zTaks uses some AES4's functions to avoid to list softwares such
Bubble.app in the application's list; and MagiC doesn't provide these
functions.

> Are there
> other things you're intending for this program that aren't in it yet?

Yes, for example, I will add a ntp system to synchronize the system
clock with Internet... and that will works only with mintnet.

> Could you have the program check for which OS it is run on and disable
> the functions that don't work when run on Magic? Just curious.

Off course, I can but it means to recode many things and I haven't the
time(and the will) to do that, sorry :/

Cheers,
Zorro

Hi,

> Great job Zorro!

Thx :)

> I've just tried it. One comment: if I set the "use
> image palette" option in thing, then first ZTASK looks ugly

If your system palette is not 'standard', you can change the colors used
by ztask. To do that, you will need to edit the "ztask.inf" file located
in your HOME directory.

In the next beta, I will add a preference panel to do that.

> and then the whole desktop.

For sure, this problem has nothing to do with ztask.

Ciao,
Zorro

6208. Re: What is the largest newest monitor I can hook my STe up to?

a decent television that has an rgb scart input will work wonders for colour modes, even if it doesn't, if that computer has composite video out thru one of the pins on the monitor socket you could use that to connect to a TV. Obviously, these methods are much much clearer than using the RF out, before dismissing me so quickly :P

obviously your not interested in mono mode since your using the SC1224.

Hello,

This new version has 2 updates:

- The ability to select which joystick to use (from the configuration file).
The joystick used is printed on the screen.
- A m68k asm audio mixing routine, which should be faster, especially on
slow systems.

The new version if available on my website.

Zorro,

You too are a Godsend to the Atari community!! All of you who are still developing for our beloved machines are!! May you all continue your marvelous work and never lose heart in it!!

Hopefully in the next couple of weeks I can get my Falcon/CT60 up and running again, then I'll be able to try out your software!! :)

I hooked my STe up to my 17 inch Compaq VGA monitor. Worked fine, but just a
little fuzzy. I did buy the mono adapter which allow direct hookup to a VGA
monitor. It was crystal clear. Oh, I used a video converter and the Video Key
to hook up my STe to the 17 monitor to get color.

Hi Patrice,

Seems like 0.47 is quite unstable on my setup (CT60, FreeMiNT/XaAES). I
haven't been able to go further than the setup menu, where it crashes.
The results with "-audio off" is the same.

Regards,

/Joakim

6216. new Falcon 030

Falcon latest news ....
== Atari Falcon 030 4mb ram and now with 128mb CF hard drive! ==
Well, I've fitted a CF-IDE adapter with 128mb card to my new Falcon and then had to scratch my head to remember what to do next ?
I found some old disks with first Gasteiner hard disk manager, but that only works with scsi disks, then I tried ICD Pro 6.5.5 and it set up everything perfectly.
I've only tried running an Infocom game on it so far to make sure everything was Ok, so my next question is .....
What software should I try. There's so much you hear of, Magic, Mint, Thing, Teradesk, etc. etc. and its been years since I last used an ST, what is the must have software to run on a Falcon ?
I'd like to connect it to my PC network as well, easy or not ?
Cheers
Jammer

Source record: 9042

I have decided to reduce my inventory of classic computers, so reluctantly the ST stuff must go. I have a medium-sized collection of ST stuff including a Mega 4 STE, 1040ST, a couple of hard drives, floppies, Diskcovery cart,software, disks, mags., etc. I estimate it will fill a trunk of a full-sized car, and maybe some to the back seat, but a pickup truck should not be necessary.

If you are interested, here are the "rules:"

1) PICKUP ONLY -- central Indiana -- southwest of Indianapolis.
2) AS-IS. It's been stored in my (heated) garage and family room for about 10 years.
3) ALL or NONE. You take it all -- no pick and choose.
4) The actual pickup date will be at mutual convenience in later April or May -- after the weather has settled a bit, and I have a chance to separate the boxes of items.

If interested, "reply to author".

Thanks,
Larry

6218. Ben's Birthday Bash!

This March I'm celebrating my Birthday! If you want to bless me, I'm trying to raise Capital to buyout an Atari Dealer of all his Atari goods! So give me your Atari business, send all Atarians Marching my way and help save Atari goods from extinction, buying from Ben Saves Atari!

I'm creating a NEW Atari catalog. Catalog's name is NEWINBOX.TXT compiled from all items NEW in BOX from all my other catalogs made up of Hardware, Games/Software and Books for the 8 Bit, ST & Jaguar! Instead of 38 columns of text width it will be 80 column width, Most entries will be 1 line each and sorted alphabetically by title. You'll only find my NEW items in this catalog as I'm removing such NEW item's from their other catalogs.

http://BensCatalogs.Atari.org Atari's for sale!
http://www.aracnet.com/~atari/adoption.htm Atari Adoption Agency!
http://www.aracnet.com/~atari/birthday.htm Ben's Atari Birthday!
http://www.aracnet.com/~atari/wantlist.htm What Ben Wants!

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. Customers love the speedy service! I have lots of Atari SoftWare & Books. Which I can send by Media Mail Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/ Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

Back in the day before Apple was cool outside the geek world, they hired a British guy, Jonathan Ive, who has been pretty much solely responsible for the design innovations seen in apple products, from the coloured imacs and sleek design of other apple products, to the ipod and its popularity; he's made apple products desirable, mainly due to looks alone.

If Atari was equipped with the services of this guy; and say, the Falcon had been released in the style of an iMAC, does anybody think this could've turned the company around?

Of course - but at the time the Tramiels were too busy worrying about
the frigging game market - musch as Apple is with the iPod market these
days

Sad really, I still have fond memories of my MegaSTE

>Sad really, I still have fond memories of my MegaSTE

TBH, I don't think so at all. Atari's problem never was the design, it
were the logistics.
They always promised heaven and more and by the time the products
finally were available (IF they ever saw the light) the market had
been taken by competitors.

So, IF the Falcon would have been released way earlier (let's say
about the time Jack & Sam initially announced the product), Atari
might have gone another way.

But it went the other way.... yes.

I still own an STf, a Mega ST and a fully equipped TT, but these days
they only gather dust.

Atari did have a guy like Jonathan Ive. His name was Ira Valedesky (I'm sure the last name is not spelled correctly). Who do you think designed the beautiful ST/STe/TT cases? :-)

I'm almost positive Ira would have created a cool case design that would make iMac look clunky if the Falcon line survived until 1999 when the iMac was released. Remember, Macs were still boring beige boxes back in 1993, so even the 1040ST design still looked fresh to a PC/Mac user.

But Atari being cheap as they are, they didn't want to pay the manufacturing costs of a new case design since they had lots of 1040ST cases around already. "Let's just remold the back and save lots of $$$" So the Falcon was released in the same old 1040ST case. While the case was nice in 1986, I think many Atari users thought the design was old by 1993, and it really needed like a 1990s case.

However, there was a new case in design. Have you seen the MicroFalcon040 design? =>NICE<= Beautiful design in my opinion. Hell, I'm sure Sony agrees too as they copied the design for the Playstation 2!

So, no Atari didn't need Jonathan Ive...they already had him! [Except his name was Ira V. (don't want to murder his last name again <grin>)] They just never got to use him enough, that's all.

I hate to say this, but Steve Jobs has final say in product design.
Has even rejected a few of Ive's designs including the one to replace
the original iMac which later became the iMac G4.. I think the eMac
was the orginal iMac replacement but was relegated originally to
education market and the iMac G4 that Job's invensioned became a
reality.

Also the total integration between iPod and iTunes is what has made it
the market leader. As aapl opens more retail stores worldwide, the
iPod will further the strangulation of pushing more competitors out of
the market. Plus the iPod is being used to draw users to the Mac
platform as a peripheral.

If atari was to remain in business, the Tramiels had to go.

I use midi on my Falcon and 1040STe. Cubase Audio Falcon and Notator SL primarily, but also some other sequencers/utilities. One thing I wish I could find is a simple midi file player that is Multi-tasking friendly. It would be nice to just click on a MIDI file and have it start playing on my synth without loading up a sequencer, then loading the file.

did you know of the install application from with the gem desktop ---menu
bar?

i'll work on it.,but there is one program i remember ,
from a guy who resided in british columbia ,canada.
its called smf..simple midi player ..if i remember his name was rob ..uhm
something???

back to the install application just single click on the program, which uses
the midi file...example cubase or notator...then go up to the menu bar and
choose install application ...type in file extension then click enter/ok
...now everytime you double click on ...example a .mid file ...the related
program starts and initiates the target file. cool , did you know of this?

Without entering the Atari vs. Apple 'what-if' debate, I would just like to note that zip (of the InfoZip zip + unzip package that is available for most platforms) in most cases can fix a corrupted zip archive so that the good files in it can be extracted. Zip is to be used with "-F" or "-FF" option (uppercase "F"!). It is interesting that this capability exists in zip but not in unzip.

I'm using MIDI for my job every day :-)

I'm using a Mega STE4 with Cubase Score 2.0r6 or Logic 2.5 for
sequencing music with 6 expanders, and using synthetizers editor too
(Synthworks M1, Synthworks TG77, Nord Lead Editor, SPD-11 Editor,
EPS16+ Patcher, Avalon ...)

Many musicians tell me how to convert Cubase Arrangement File or
Cubase Song File on Standard MIDI File (because they don't have any
Atari again, and they use Atari emulator (Steem) on PC Windows XP, and
they have any problems for read their Atari Floppy Disk on PC ...) :-)

Maybe there is here a suggestion ;-)))

Yes, I'm aware of this process, but I'm really looking for something
I can use with Mint on my Falcon and MagiC on my STe. Just a simple
player that will work on multi tasking OS and no dongle to worry
about. I'd love it if midi could be added to Aniplayer!

Thanks,
Joe

I tested 0.48, except some graphical jerks from time to time (I've got
a feeling it depends on the samples playing - more samples, more chance
to see it) but I observed onyl one crash. Tested under TOS.

Hi,

ARAnyM (Atari Running on Any Machine) <http://aranym.atari.org/>
is an Atari Virtual Machine also running under MacOSX.

The 0.9.3 ARAnyM version for OSX.3.9 (or above) is available at :

<http://eureka.atari.org/MacAranym.zip>

It is built with Xcode 1.5 and optimized for G4 and above. It
includes a preview boot disk image similar to AFROS (Atari Free
OS) and SDL. Ready to use ...

Feedback is welcome.

Have fun :)

Hello all,

In the past two days my Plextor IDE drive has been causing my Western Digital IDE to boot late after the system has a warm re-boot. It used to take only 1-2 seconds before the IDE hard drive kicked in, now it takes about 30-40 seconds. It does not affect Magic or Tos, but I cannot boot Mint. What happens is that after 15 seconds the Hades thinks no hard drive is there so it boots up what in on the floppy. I am suspecting I need a new cable. Anyone else have an idea?

I wouldn't be surprised if it worked. This requires that you
have a suitable floppy drive for your Macintosh.

You just have to add "Floppy = /dev/fd0" in the "config" file.

You want NVDI. It has drivers for most printers of that generation, and
some modern printers (with LPT port) will also work because the
languages are somewhat backwardly compatible.

I don't know if you can buy this now, or where you can get it, sorry.
Someone else here will know.

ID would have been installed in the basic package I guess, so I don't
understand why you don't have it.

After some poking around on sparemint.atariforge.net I have found the
package you want here:

http://sparemint.atariforge.net/sparemint/html/packages/sh-utils.html

Good luck.

Thanks Coda, I found it myself by now. But my question is still: how
can I know which package contains a specified file?
I'm trying to install mint totally manually, so there is no "basic"
package "just" packages (rpm). This is a hard work since I have no
experience only with Windoze.

Nima,

I've been hoping to find the demo of the most recent Photoline TT somewhere, but can't. I'd like to try it out on my CT60 Falcon. I used to have the demo on my standard Falcon, and thought it was a really nice product a long time ago, but it was a bit slow for that system, so I deleted it. On your web site you have a link to it, but I get a "File Not Found" error. Any chance of fixing this? Thanks!

Sparemint uses RPMs now, right? If it does, can't you use the RPM
facilities to query?

For example, on an RPM based linux box, you (as su/root) could do a:

[root@darkforce darklord]# rpm -q --whatprovides cedega
cedega-5.0-1

This is assuming that what you're looking for is installed by RPM and can
be found in the RPM database.

Just a thought.

Hi Edward. What is it that makes you think its the Plextor doing this? I
mean, could it just be your hard drive going bad?

I also wonder why just after a warm re-boot. It doesn't do this when its
cold?

Le Tue, 21 Mar 2006 02:24:17 -0800, Joe Iron a ï¿œcritï¿œ:

> Did you find something?

Yes. When putting the m68k asm routine in Heretic, I found that the volume
was too low in Doom (samples are played with a volume from 0 to 15,
instead of 0 to 127). This is fixed.

But there is still a big problem: memory allocated for samples is still
freed when the sample is playing, hence some possible crashes. This is not
related to the m68k audio mixing routine. And this is what causes a
Z_CheckHeap error.

And for people willing to help with testing it, just saying 'it crashes'
is a useless bug report. At last, hardware/cpu/os used is a minimum.

That's the tricky part. Try finding a USB floppy drive that reads
anything but HD (1.44 MB) floppies.

> You just have to add "Floppy = /dev/fd0" in the "config" file.

Rather, convert them to disk images on a 68k Mac :-)

Hi,

You can find the last version of zTask on my webpage.

Here the changelog:

News:
-----
- Preference panel added.
- With Xaaes, "XaSys" is not more listed as a GEM process.

Bugs fixes:
-----------
- The first drawn of the process list in the Task Manager
was corrupted.
- Some littles bugs fixed.

Ciao,
Zorro

First of all, Happy New Year everyone! :-)

We're trying to kick things off right at The DarkForce! BBS, so in the spirit of the season, we are continuing our tradition of monthly prize giveaways.

This month, January 2006, one lucky Atari caller will win a free subscription to ST Magazine. Also, since its almost NFL playoff time, this months featured game is AFL Football! The lucky winner of this game will receive a $25 cash prize. Slots are limited to the number of teams available so don't be left out. Also, rumor has it the Sysop is playing...who doesn't want to take a crack at bashing the Sysop? :-)

Good luck everyone! :-)

Hi Ronald,

Yes, but my problem is that what I am looking for is NOT installed and
I want to know which package to install.

You betcha - although I can't explain why, whenever newsgroups goes down
from my ISP, when they do finally come back up, the first 1-2 times I
access the newsgroups I'm subscribed too, well, old, old messages get
reposted.

This is using PAN under Linux.

Anyone have any ideas as to why? I've had it happen several times. :-(

Okay, if I'm following you correctly, then what you are looking for is
dependencies?

Hmm, when you go to compile the software, (I'm assuming ./configure, make,
make install?) it should tell you whats missing. As for RPM, it will too.
Too bad we don't have something like YUM or URPMI or APT-GET. That way,
those pesky dependencies are usually taken care of for ya.

Even under modern Linux distros, sometimes its a job to install software.
:-(

Not really dependencies. In my case the following happened:
- I installed BASH from BASH....rpm (binary). It worked well.
- Then I installed a couple of rpms (binary), all sucessfuly.
But one of them installed/replaced a script that tried to use the
command "ID". Since then, when I start BASH it complains abut the
command "ID". Maybe the references list of one of the package was
incomplete. (there is no provides specified manually for rpm)

It is not the drive as I just bought it two months ago. I did solve the
problem. I installed a new IDE cable and that did it. I did not think it would
work since I used the cable that came with the WD hard drive. It is a 40-pin
80 connector cable where as the one that came with the Hades was a 40-pin 40
connector cable. It worked though and that all that counts. Now I can go and
try to get my Mint partition up and running.

How about using RPM to remove those couple of packages, then reinstall the
bash RPM?

Not the best solution, I'll agree - but it should work.

Sparemint's dependency tree is really trashed. We're quite lazy due
to the static linking situation so as much as we try, we do inherently
miss stuff.

The new sparemint site, http://dev.sparemint.org will have a file search
function as part of a larger query system I'm implementing soon but it's
not done yet. The easiest way to get done what you want to get done is
simply to get in touch with an easymint using friend and have them do rpm
-qf /bin/id

Here's an example of the output on my Fedora Core 5 system:

[mduckworth@evil ~]$ rpm -qf /usr/bin/interdiff
patchutils-0.2.31-2.2.1

But there's no way for your freemint system or RPM to give you information
about packages that it doesn't even have ;)

Thanks,
Mark

Possibly, after your ISP sorts out the usenet problems, they fiddle with
the message ID counter for each group, as a safety measure. Pan cannot
know this, so continues with message ID's it has, resulting in the
retrieval of old messages.

There is a tool that I downloaded for PC but it would not open any of
the sparemint RPM's. I can't remember the name of it now, but I thought
I'd tell you in case you have the same problem.

This March I'm celebrating my Birthday! If you want to bless me, I'm trying to raise Capital to buyout an Atari Dealer of all his Atari goods! So give me your Atari business, send all Atarians Marching my way and help save Atari goods from extinction, buying from Ben Saves Atari!

I'm creating a NEW Atari catalog. Catalog's name is NEWINBOX.TXT compiled from all items NEW in BOX from all my other catalogs made up of Hardware, Games/Software and Books for the 8 Bit, ST & Jaguar! Instead of 38 columns of text width it will be 80 column width, Most entries will be 1 line each and sorted alphabetically by title. You'll only find my NEW items in this catalog as I'm removing such NEW item's from their other catalogs.

http://BensCatalogs.Atari.org Atari's for sale!
http://www.aracnet.com/~atari/adoption.htm Atari Adoption Agency!
http://www.aracnet.com/~atari/birthday.htm Ben's Atari Birthday!
http://www.aracnet.com/~atari/wantlist.htm What Ben Wants!

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. Customers love the speedy service! I have lots of Atari SoftWare & Books. Which I can send by Media Mail Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/ Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

Thank you for your help so far. Things are getting better. But there
are still questions:
- I downloaded the latest kernel from atari-sorce.org, but it searches
its files in "c:\mint\" instead of "c:\mint\1-16-1". Why is this? Or
that has different version number? How can I check that?
- I want to domesticate "/sbin/init". Previously I started NAES with
"GEM=..." in mint.cnf. I want to change it to "INIT=U/sbin/init".
Curently it reaches the login prompt and I can log in. But how can I
tell it to start NAES?

Always welcome news to see commercial suppliers still supporting the
Atari market. I noticed your web page has several old dates, mostly
from 2001. You may want to update those so other people who come across
it realize you are still active.

Open /etc/ttytab and comment out the line:
#console "/usr/sbin/getty console" vt52 on secure

and add the line:
console "/path/to/xaloader.prg" tw52 on secure

Cheers,
JF

What I really need is a CSS guru. I'm coming to terms with the fact that my sense of design really sucks. I'd like the new site to look really sweet. The site is done in MySQL btw, and I can handle all those queries as I do that stuff for work. If for some reason you wanted to help out with php/mysql, let me know. The project certainly needs volunteers.

Thanks,
Mark

Thanks, that worked. There is one more problem to solve: previously
when I had to log in, I could execute any commands no matter what was
the current directory. Now if the current directory for example /bin I
couln't execute "id" which is in the directory /usr/sbin. I tried to
set the "path" environment variable in the config file of NAES. No
success. What to do?
Is there a way to force login?

Isn't the initial PATH set in the mint.cnf? Or what about /etc/profile?
Also for users paths there may be another PATH statement your local
.profile. I can't look at my mint setup at the moment to check.

> Is there a way to force login?

I think you can do this by not using the INIT statement but instead use
GEM='/path/to/the AES', and have TW bring up a shell once the desktop
has started. Maybe, I can't really remember.

> Falcon.

Just a quick follow up here - being brain-dead on odd-numbered days, it took me awhile to figure out the easiest solution to this problem. I simply put the newer Plextor in my Falcon (that supports the bus arbitration it needs) and put the older Plextor in my Mega ST setup. Duh. Sometimes, the most obvious solution... :-)

Now though, I've got another question. The older Plextor in my Falcon was nearly silent, with maybe a little increased sound during write operations.

The newer model does this speed up and speed down routine - like its ramping up to access speeds or something. Very noisy. Anyone know anything (settings?) that can be adjusted for this?

Thanks everyone.

A midi player that would work under a multitasking os would be very handy. I recall there was a midi player that used a small liberary of samples for playback of midi files, but it never worked for me. I don't remember it's name, or if it worked under MagiC/Geneva/Mint? I use CAF on a CT60 for sequencing, recording and scoreing.

NVDI 5 has drivers for the HP Laserjet 5L, 5P/5MP and the 5Si/5SiMx plus some other HP LaserJets. Once of these may work just fine. I was able to use NVDI 5 to get my wife's HP Laserjet 2100 to work with my Hades.

On my Falcon PHPlayer works under MiNT. It can play samples, but also MIDIfiles, using samples. It doesn't do that job very reliable on my system. Seems to be quite buggy, or my Falcon is not fast enough for that job. I would say, search for phplayer.zip via Google, and give it a try.

6334. [ANN] Troll 1.2

Newsgroup: comp.sys.atari.st
Date: 2006-03-25 11:20:35 UTC
From: Pierre TON-THAT <geek@atarians.com>
Message-ID: <44252782$0$1149$7a628cd7@news.club-internet.fr>
Source record: 8911

Bonjour

News release of Troll Newsreader (and now basic email client included).
Download on my homepage or directly in the folder:
http://rajah.atari.org/files/ -> troll12_uk.zip (140KB)

New snapshot @ http://membres.lycos.fr/nef/images/snapshots/troll_snap.png

New features:
+ Basic email client implemented (carefull, not full. there are not yet
multiparts management, attached files nor more than one recipient).
* one or more POP3 accounts (retreive and/or delete mails on remote
server), with local receiving mailbox.
* misc options (scan every 5 minutes / automatic scan)
* archive folder for sent mails
* one or more archive folder for received mails
+ List of emails address, you can collect them.
+ Incomplete UTF-8 decoding (occidental charset) when reading.
+ Reformat text if width > 80 characters.
+ Some changes in the interface, some pop-ups (with button "~") change with
the context.
+ Format=flowed management.
- Changes in the ST-Guide documentation (tutorial).
- Some bugfixes.

I repeat: BASIC email client. Cc: multipart & attached files may come
later but I'd rather like to implement a RSS newsfeeder part in the
program.

Also carefull: some spams fool the POP3 server and indicate a bad mail size.
I have set a large buffer, but it may be not sufficient some time.
Better delete theses spams directly on the remote mailbox.

Voilï¿½ :)

I like it too. I did notice one problem though: when I open the "preferences" dialog and then the "misc." tab, after that all the resource texts are badly positioned. Looks really ugly. I'm testing it with recent versions of Aranym+EmuTOS+Fvdi+FreeMiNT+XaAES+Teradesk right now.

Another more positive remark: Unlike the shutdown routine that is used by the XaAES taskmanager, zTask's shutdown cleanly unmounts and shuts down my (Spare)MiNT system also on my Aranym box. Maybe Zorro can give the XaAES developer(s) a helping hand ?

Hi,

We advise you to visit :

<http://www.haveland.com/index.htm?povbench/index.php>

to check Skyvase button and to search ATARI.

We've performed the Skyvase benchmark using ARAnyM 0.9.3
and POV3.1g 030+881.

We're about 8 time faster than a Falcon CT60. That put
ARAnyM at the level of :

Pentium-II@350MHz or a
K6-II@500MHz or a
Celeron@400MHz or a
AlphaEV56-21164A@533MHz

With a host machine Athlon2000+@1.67GHz

That's real funny :)

Best regards,

So it seems. I just tried with Aranym/FreeMiNT/XaAES/Teradesk but now with
TOS4.04 without fVDI and the problem disappeared.

Ho well ... That's true. But you are speaking about a native (rewritten)
OS compared to ARAnyM that is an ATARI Virtual Machine, aren't you ? It
runs on every machine.

Amiga computations on the Skyvase scene are impressive indeed !

Funny is this:

Aranym = 1m46sec = 106sec
CT60 = 8m23sec = 503sec

503/106 is NOT 8! But i guess thats Aranym math, so no wonder it does
skyvase calculation that fast ;))

Looks fine here with, seemingly, the same setup, except for Thing. Are
you running fVDI beta6? It fixes a lot of display glitches with WinDom
apps like zTask.

If by XaAES' shutdown you mean CTrl+Alt+Del, it works fine here. I've
never shut down from the task manager.

Cheers,
JF

Do you have a Easymint/SpareMiNT-based setup ? If I use Ctrl+Alt+Del or
the Taskmanager, I can shutdown, but my sparemmint ext2 partition is not
correctly unmounted. The next time I boot the system is forced to do a
time consuming filesystem check. I can only shutdown cleanly with
U:/sbin/shutdown and now als with zTask.

Source record: 8931

My progress:
- setting the "path" environment variable in mint.cnf solved my
problem. (naes.cnf would have been ok if I hadn't mistyped)
- isn't etc/profile processed only on login? Can somebody confirm that?
- What is recommended: using INIT=/sbin/init or GEM=...?
- Forcing login would be still fine ...

Setting of Mint from the ground isn't so hard as I expected. I know I
still far from the end. I have to setup the network when my EtherNAT
finally arrives. I wish I had experience with linux...

See who wins at GCC too ;)

I love aranym, but benchmarks are silly. We all know it's fast like a
Transmeta Crusoe is fast. Fast at repetitive code.

Thanks,
Mark

Hi All
I too have a Falcon with the same trouble.

I've found a source for the chip in question :- MK48T87B-24.
The supplier is close to where I live (Southern England)

I've ordered a couple (Approx 20GBP each) They should arrive 10
to 14 days.

I'll be testing them when they arrive. IF the battery is still
OK I'll let you know.

Does anyone have a data sheet for this chip? If so what are the
pin numbers for the battery output?

BTW What is happening to this list. No new posts for a month,
and when I click on a message it tells me it cannot find the server. Is it
me?

Mark.

20 QUID EACH!!! Are you mad, or rich? These chips are generally 2-3
USD. Where did you order them from, Atari Workshop???

> I'll be testing them when they arrive. IF the battery is still
> OK I'll let you know.

So they are not brand new? These chips are rated at approx 5 years life
(although some are still working at 15 years) so if they are not brand
new then you have been had.

> Does anyone have a data sheet for this chip? If so what are the
> pin numbers for the battery output?

They are pin compatible with the Dallas DS1287 and DS12287.

> BTW What is happening to this list. No new posts for a month,

6371. FS: S/PDIF interface for Falcon, software included

Newsgroup: comp.sys.atari.st
Date: 2006-03-29 08:13:15 UTC
From: Mike <no@spam.com>
Message-ID: <vkrWf.50182$d5.206685@newsb.telia.net>
Source record: 8948
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

For sale:

Pocket S/PDIF interface (PSI BlowUp) for the Atari (or compatible) Falcon.
Optical S/PDIF in and out.
Coax S/PDIF in and out.

An infra-red device is included for infra-red communication using the Falcon.

I've used it with a C-lab Falcon mkII and it works fine.

Data-DAT software is included, to take backup copies on DAT.

Price: $50 plus freight from Sweden.

Here's an image of the package:
http://web.comhem.se/~u11149557/BlowUpSPDIF-interface.jpg

Pay with PayPal. I send the hardware when you have paid.

Email: mikael@mhc.se and please write "S/PDIF interface for the Atari" in
the subject line to avoid accidental delete of the email.

Regards
Mike

I'm talking about both. If I turn sound off, the speed is about 50%
faster than with sound. ~10 fps with sound ~15+ fps without sound

Maybe I have a special version of Thing. It came bundled with N.Aes and
I couldn't start it with XaAes at all. I tried to contact the
developers of thing if there is a way to upgrade to the full version,
but no response came back. Do you think if there is a way to obtain the
"not only NAES" version somehow?

Oh, okay. My bad. I thought you were saying it was slow. Period.

Game plays great here...

Message-ID: <ztydnU-0AaRMf7fZRVny2w@bt.com>
Source record: 8856

Hi All
Following on from the Falcon Battery thread, I have found a
source for the chip concerned.

I haven't fitted it or tested whether the battery is OK yet.
Anyone got the pin outs for
a MK48T87B-24? The supplier didn't have any info.

If anyone else is interested I will find out how many they have.
(I bought 2)

Mark.

6383. Possibly selling LOTS of Atari stuff -- Mega STE, Mega ST 2, 1040, Cubase 3, Midex+, Monitors... from OTTAWA

Newsgroup: comp.sys.atari.st
Date: 2006-03-30 01:06:23 UTC
From: Peter <petervh@gmail.com>
Message-ID: <1143680783.037846.228030@u72g2000cwu.googlegroups.com>
Source record: 8860

Hello,

I have a fairly large collection of atari computers, and i am considering selling off some of it in order to pick up a korg polysix!

Here is what i have:

Atari Mega STE - ABSOLUTLEY MINT! no noticeable yellowing, no case cracks, gorgeous example. 4 megs of ram, 150 megabyte harddrive, keyboard in mint shape, a really great mouse (works as well as a good pc ball mouse). comes with a lot of software pre-installed, mostly music including band in the box and dr. t's kcs v5, as well as a ton of desktop publishing software.

Atari Mega ST 2 - beautiful shape! no noticeable yellowing. 2 megabyte computer, includes a manual, keyboard in wonderful shape, and a good clean mouse.

Atari 1040 ST - perfect working condition, nice clean keyboard, some paint drops on the back (guess it was stored in a garage?). includes a good working mouse.

Atari SM124 Monochrome monitor -- works nicely!

Atari SC1224 Color monitor -- great condition!

Steinberg Cubase 3.01 - includes dongle, original disks, and all original manuals!

Steinberg Midex+ - mint condition midex+, offers up four additional midi outputs, two inputs, and smpte in/out. essential for working with cubase!

I think this is all, though i will be getting two more monitors within the next couple of weeks. I live in Ottawa, Ontario, Canada. I want to know how much people would be willing to pay for some of these computers, please post below, or e-mail me at petervh@gmail.com with offers. I will also consider ebay, but i want to try selling here first...if you'd like i can provide my 100% positive ebay feedback page.

Not completley positive I actually want to sell these things...but I really need some new synth gear more than I need these computers. If the offers are good than we can make something happen.

- Peter

Well Im selling off more of my atari ST collection. The wife says we
must make room for our cars to go into the garage and whats in the way?
You guessed it the Atari collection. I have boxes and boxes and many
shelfs filled with Atari items. I have a load of software(original)
that needs to be cataloged and put up for auction. I have listed a few
items on Ebay a few days ago and have more to come
Currently 1040STE, Megafile 30, software, and More.

You can check it out at:

http://search.ebay.com/_W0QQsassZatari_onlyQQhtZ-1

Thanks to all, AO

I would like to register Thing and I have tried to contact the author
directly using the email addresses from InterActive but to no avail!

Any clues as to how I can contact him?

Thanks.

6400. [UTD] April Release of Eureka

Newsgroup: comp.sys.atari.st
Date: 2006-03-31 06:04:16 UTC
From: Francois LE COAT <lecoat@atari.org>
Message-ID: <442cc660$0$20177$8fcfb975@news.wanadoo.fr>
Source record: 8876

Hi,

The software "Eureka" is updated and released on its WEB page.
It is a "2D Graph Describer and 3D Modeller". You will fetch
it at :

<http://eureka.atari.org/eurka604.zip>
That is the Complete Common Edition

<http://eureka.atari.org/eurka020.zip>
Is the Complete 68020 Edition

<http://eureka.atari.org/eurkafpu.zip>
Is the Limited FPU Edition

<http://eureka.atari.org/eurklite.zip>
Is the Lite Edition, working on early ST with 720kb floppy

<http://eureka.atari.org/lib_dgem.zip>
Are Dynamic Libraries Extensions for Eureka

<http://eureka.atari.org/tiny045.zip>
Is the OpenGL Extension (requires previous package)

What you can do with this release is browsing through
2D and 3D objects, without any prior knowledge. That
also makes 10 years that Eureka comes on internet.

I wish you big fun with this new STuff !

Best regards,

-- François LE COAT
Author of Eureka 2.12

6402. FS: Cubase modules for Atari (StyleTrax and the Studio Module)

Newsgroup: comp.sys.atari.st
Date: 2006-03-31 09:51:07 UTC
From: Mike <no@spam.com>
Message-ID: <fY6Xf.50363$d5.206914@newsb.telia.net>
Source record: 8879
Cross-posted to: comp.sys.atari.st,rec.music.makers.marketplace,rec.music.makers.synth

StyleTrax and Studio Module are two add-on software modules for Cubase on Atari.

These modules were not part of the standard Cubase software, but could be bought separately as extensions.

I sell these two together, not separately.

StyleTrax - you can create your own styles with this module (a bit like the auto-accomp feature on keyboards).
Many styles are included on a separate diskette. And you can make your own ones. A manual is included, which
is supposed to be inserted into your original Cubase manual/binder.

Studio Module - this module lets you record system exclusive into Cubase, edit it and then send it back.
A manual is included, which is supposed to be inserted into your original Cubase manual/binder.

Price: 20 USD + freight from Sweden which is approx 36 USD.

An image of the boxes, disks and manuals:
http://web.comhem.se/~u11149557/CubaseModules.jpg

You just put the modules in a folder and then they become available in Cubase on your Atari.
There's a menu in Cubase where you can active or deactive them. Installation instructions are
included in the manual and on the diskettes.

Pay with PayPal.

Email me on atari@mhc.se

Regards
/Mike

6404. Re: Falcon NVRAM chip

Newsgroup: comp.sys.atari.st
Date: 2006-03-31 20:07:16 UTC
From: Mark Earwood <mark.earwood@STUFFbtinternet.com>
Message-ID: <kbGdnXL_kp1mFrDZRVnyjA@bt.com>
Source record: 8881

Hello All
First of all let me apologise for splitting the Falcon battery thread. For some reason I could not read any posts for about 2 weeks. I thought I'd fixed it when I wrote the two messages, but only when I unsubscribed and resubscribed in Outlook Express did it reset itself today.

My thanks for all the replys and the help which I will be following up on.

The external cell solution looked good, I found some holders and was ready to try it when my doubts were raised when I read that the chip uses a 5v supply. I came across this seller on line which at the time seemed cheap. (Nevertheless even at 11USD or 3USD by the time they get to England with VAT and duty to pay they might even be more expensive!!)

I'll try and have a go this weekend, time and F1 permitting.

Thanks again to everyone Mark.

6405. [ANN] Troll 1.2B (bugfixes)

Newsgroup: comp.sys.atari.st
Date: 2006-03-31 22:25:57 UTC
From: Pierre TON-THAT <geek@atarians.com>
Message-ID: <442dac75$0$6600$7a628cd7@news.club-internet.fr>
Source record: 8882

Bonsoir :)

Small release for bugfixes, download on my homepage or directly in the
folder http://rajah.atari.org/files/ -> troll12b_uk.zip (140 KB)

News & fixes:
+ 'Draft' state for messages: kept and not sent until state changed.
+ Possibility to set draft state by default to new messages
- Bugfixes:
- the posts were not saved in the cache (evenif cache activated).
(thanks Luc PEYROU)
- sometimes 'new mail' item disabled.
- email address confusion when responding to a post or mail.

Apologizes for the inconvenience ;)

Source record: 8883

Hello,

I just put three items that may be of interest up on ebay. A gorgeous
Mega STE, a copy of Cubase 3.01 with dongle and manuals, and a Midex+
midi/smpte expander! Follow the links below to check out the items. I
am located in Ottawa, Ontario, Canada -- and I am certainly open to
local pickups.

Atari Mega STE:
http://cgi.ebay.ca/ws/eBayISAPI.dll?ViewItem&item=8790028744&rd=1&sspagename=STRK%3AMESE%3
AIT&rd=1

Cubase 3.01:
http://cgi.ebay.ca/ws/eBayISAPI.dll?ViewItem&item=8790031300

Midex+:
http://cgi.ebay.ca/ws/eBayISAPI.dll?ViewItem&item=8790032903

Thanks,

- Peter

A couple of years ago I had a full room of ST's and parts, all got serviced
and upgraded, probably got about 10 ST's now, a lot of the stuff got dumped
as nobody wanted it, they do tend to take up a lot of room :-\

1. The supply for the chips is 5V yes, but they have an internal 3V
cell.

2. You dont pay VAT and DUTY on $11 or $3 items coming from the U.S.

Thank you. That clears that up. I'll have a go with the external
cell first, although I am getting conflicting info regarding which pins to
connect to.

> 2. You dont pay VAT and DUTY on $11 or $3 items coming from the U.S.

True. Although to make it worth while with postage costs I would
order a few which would take it over the limit- currently 18GBP. Several
small light packages are just the sort of thing to get lost in our postal
system!!

The local supplier charges 12GBP + VAT + Special Delivery.

Mark.

Once you've *carefully* prised the top of the NVRAM chip off you'll see
the original cell in any case!

I'd say that this way is a better option than replacing the chip, it
avoids having to strip the motherboard out.

6412. TTF font problems

Newsgroup: comp.sys.atari.st
Date: 2006-04-01 12:27:37 UTC
From: xlator@cix.compulink.co.uk
Message-ID: <PIudnQerG4kk7LPZnZ2dnUVZ8qOdnZ2d@pipex.net>
Source record: 8889

I am still using an Atari Falcon for all my work, mainly DTP.
Thanks to NVDI, I can use all Speedo and most TTF fonts without
problems.

However, I have come across a range of PD TTFs which, though they
work fine on a PC under Windows XP, will not display on the Atari
at all. These come from several sources, and tend to be the same
ones (presumably from a common original source); the latest I have
come from Serif's 'Art Gallery' CD. On that, from 402 fonts, only
31 show their names in a listing with LISTFONT.PRG. The ones that
don't include headers containing NULL-separated Copyright notices
such as for ADMA.TTF (here the NULLS have been replaced by spaces):

C o p y r i g h t (c) 1 9 9 0 - 1 9 9 3 B r e n d e l
I n f o r m a t i k & S o f t M a k e r S o f t w a r e G m b H .
A l l r i g h t s r e s e r v e d .
A d a m s k y S F R e g u l a r
A l t s y s F o n t o g r a p h e r 3 . 5
A d M a n R e g u l a r A d a m s k y S F
A l t s y s F o n t o g r a p h e r 3 . 5

or CALI.TTF:

C o p y r i g h t (c) 1 9 9 0 - 1 9 9 3 B r e n d e l
I n f o r m a t i k & S o f t M a k e r S o f t w a r e G m b H .
A l l r i g h t s r e s e r v e d .
A r i s t o c r a t S F R e g u l a r
A l t s y s F o n t o g r a p h e r 3 . 5
C a l l i g r a p h i a R e g u l a r A r i s t o c r a t S F
A l t s y s F o n t o g r a p h e r 3 . 5 3 1 . 0 1 . 1 9 9 4
A r i s t o c r a t S F

although ELMLT.TTF seems to work, which includes:

Copyright (c) 1990-1993 Brendel Informatik & SoftMaker Software GmbH.
All rights reserved. C o p y r i g h t (c) 1 9 9 0 - 1 9 9 3
B r e n d e l I n f o r m a t i k & S o f t M a k e r
S o f t w a r e G m b H . A l l r i g h t s r e s e r v e d .
Elementary Light SF E l e m e n t a r y L i g h t S FRegular R e g u l a r
Altsys Fontographer 3.5 Volkswagen Regular A l t s y s
F o n t o g r a p h e r 3 . 5 V o l k s w a g e n R e g u l a r
Elementary Light SF E l e m e n t a r y L i g h t S FAltsys
Fontographer 3.5 9/23/93 A l t s y s F o n t o g r a p h e r 3 . 5 9 / 2 3 / 9 3

and ORGA.TTF is OK, which has:

(C) 1990 Brendel Informatik CologneMackintosh SFRegularFontMonge
:Mackintosh SFMackintosh SFAltsys Fontographer 3.5 4/30/93MackintoshSF
(C) 1 9 9 0 B r e n d e l I n f o r m a t i k C o l o g n e
M a c k i n t o s h S F R e g u l a r
F o n t M o n g e r : M a c k i n t o s h S F M a c k i n t o s h
S F A l t s y s F o n t o g r a p h e r 3 . 4 / 3 0 / 9 3
M a c k i n t o s h S F

Any ideas why these don't work on the Atari when they are OK on a PC?
Or could it be because the ones that work do not have NULLs between
characters at the start of the description whereas the ones that
don't work have them? (I haven't checked them all....)

6417. FS: Bus Mice converted to Atari ST mouse

Newsgroup: comp.sys.atari.st
Date: 2006-04-02 17:38:01 UTC
From: Rory.A.McMahon@gmail.com
Message-ID: <1143999481.320999.308370@i40g2000cwc.googlegroups.com>
Source record: 8894

Hi all,

Ok, I have modified some NEW 3 button bus mice for the Atari ST. These work much better than most Atari compatible mice. These roll nice and smoothly. I have stashed a few for myself ;). I have about 5 ready for shipment.

$11.95 plus shipping ($5 for US, $9 for Europe)

Here is my postal address:
Rory McMahon
831 Gee Court
Elburn, IL 60119
USA

You can use paypal for $1 more. (fujiman@netzero.net).

There is one drawback:

Nobody seems to make a low-profile shells for DB-9 connectors. Especially for machines where the mouse connector is under the keyboard. I've used heat shrink tubing to put a hold on the DB-9 connectors. Seem to work pretty well. I can put plastic shields if you use a TT or MegaSTe (or if you have mouse extenders) if you want for $.75 more. This will look a little more professional.

Thanks,
Rory

I have the Studio Module, not sure about STyle Trax. (Will have to check)

Was wondering if anyone knows how many add on modules were created and
made available for Cubase/Cubase Audio Falcon?

I'd like to see a list posted or an e-mail with what was available.

I have a nice Cubase Audio Falcon collection and am just getting into the
extras
of the program. Would like to get any modules that I don't already have.

The Lynx would have Rocked the gaming world, had it's potential been fully realized, I mean compare it to it's contemporary, the Gameboy. Monochromatic green-screen to 256 colors, mono-sound to full-blown stereo, etc. but we can all blame the Atari Corporation who should've been the first guys against the wall when the revolution came. They fumbled up everything, like the Jaguar, it's tech was unbeatable at the time, Aliens vs. Predator for instance. And the Atari ST, while enjoying a certain popularity, never fully realized its potential either, getting mostly hurridly done Amiga-ports instead of focused ST efforts. (There were some notable exceptions, like Wings of Death for instance) Atari even developed the first CD-rom for home computers, early in the nineties, but the only games made for it was a port of lame space-simulator and a interactive inventory list for a Boing 747, then they suddenly decided to drop it. Atari Corp killed the Atari machines. Bah. Had they had better management, we'd all be writing and reading this on the new Atari 4000 KFT and playing VR games with our Mindlink-visors later on.

The MAIN reason the Lynx failed was because of the low battery life.
Had it had a screen like the GBA that hardly sucked any energy allowing
people to play for hours and hours, it might very well have dominated.

I don't agree. Sega's Game Gear was a very successfull product, and had
similar specs to the lynx. Interestingly it also killed batteries, but
at a much higher rate. Sega did their marketing better, thats all.

Probably in the same class as the Portfolio's battery life, which was a big joke.
A couple of hours only.

Mike

The Game Gear ate batteries faster than the Lynx? That I don't recall.
I did like that the Game Gear was basically a portable SMS. I picked up
a GG and a $12 adaptor and had an instant game collection for it. Of
course, trying to play Phantasy Star on a 3 inch (or whatever) screen
wasn't the best setup. :)

Hi. Don't you mean the STacy? My understanding is that the Portfolio will
last up to 6 *weeks* on its battery power.

The STacy, on the other hand, ate batteries so bad that Atari finally
started shipped them without any, if I am remembering correctly.

6437. Final Frontier 2 (long post)

Newsgroup: comp.sys.atari.st
Date: 2006-04-05 16:17:01 UTC
From: "Ronald J. Hall" <dark_lord@charter.net>
Message-ID: <pan.2006.04.05.16.17.00.560462@charter.net>
Source record: 8814

Folks, we're gearing up for another round of Final Frontier 2 here at the DarkForce! BBS. We're looking to recruit more players. If you've never played FF2 before, you're in for a real treat. I'm posting the Intro here, so you can get a "feel" about what the game is like. Please be sure and read the Documentation when you play!

Final Frontier II Introduction:

As I looked up from my comm display at the alien with discolored black and green splotches all over his face, I felt a wave of pity run deep within my bowels. The tears ran down his cheeks as he sat, shaking, in the plaid Naugahyde seat beside me, slowly telling me his story.

"It was HORRIBLE," sobbed the broken humanoid." I knew I had the intestinal fortitude to handle it, being descended from Terran kings, but the atrocities committed in the FINAL FRONTIER war were just too hard to bear; especially those in THE DEAD GODS sector...that rebel DARKCHYLD's home turf!!"

'Kings? What?' I thought. I put the comm on auto and leaned back into my chair, fixing my full attention on his story.

"It all started in the general assembly right before the war," he said. "The Satharians were miffed because of Ted Turner XXXIV and his holographic

imaging colorization of something called 'I Love Lucy.' I think it had something to do with a red-haired puritan axe-murder. Anyways, distribution in the outer-rim was poor, and the Saths were literally shedding skin over it."

He leaned back in the chair with a gracefulness I had not seen in ages, picking up his tea spoon and twirling it with exaggerated movements. Anything to break

"It all seemed like a small interplanetary riot, you know, the kind that never gets any press anymore. Then that goody-goody MORDEN stepped in," He quick snorted and wiggled his nose contemptuously. "He promised the lizards he would acquire the rights to the shows and air them nationally. But instead he packed up the Saths' national treasury, stole the prime ministers wife, knocked off two holoburger stands, and, dear God, slandered the good name of the acquitted sports hero Orangutan Jumper Sampson..."

I shook my head, remembering it well. "And that's when the proverbial guano hit the gliding rotisserie blades..." I said.

"You guessed it," he continued. "Everyone went berserk, buying ships, weapons and other stuff. Interplanetary systems dissolved, governments collapsed, and

all-out chaos ensued. And that was just from the media coverage alone!" "People started colonizing planets everywhere, trying to get a foothold of power. Dr. Scholl became a billionaire! But the thing about it was nothing was

sacred," he said. "People were invading people, taking planets, and wasting each other just for kicks. It got so you had to hide in a sun's corona just to get some sleep."

"But that's when all the new developed technology started coming about," I interjected. "You know, booby-trapping derelict ships, laying mines, massive production of defense installations, trade routes and other stuff."

"Not to mention the illicit beaming of 'Sweatin' to the Oldies' onto command bridges playback consoles," he said.

I shuddered. Truly a fate worse than death...

"And that wasn't even the worst of it," the curly-haired alien said. "What about those distinguished few, ROGUE, SYSOP, MORPH and others; the real nuts! They sneaked around with weird aliases and thought no one would notice...."

"Yeah, some real unholy alliances came about because of this war," I said as I read my tactical display, looking for SPACE PIRATES. " And with the new increased galactic size, there's going to be a LOT more space to hide in.

Suddenly, the ship rocked with an explosion! Red alerts resounded across my bridge. "And shut that blasted noise off!" came a command. From the back of my mind twas some weird English-accented old man's voice. My alien copilot looked at me as if he had read my mind.

"JEAN-LUC!" we said in unison. The alien started to reach under the dash for the General Foods International Coffees, when another burst knocked him from his chair.

"Darn!" I screamed, grabbing the joystick like it was the last Pina Colada in Tahiti. I targeted the pirates with my newly-installed Photon Cannons, and blew them 10 levels past Hades.

I started to let myself relax, but I noticed something peculiar. The graceful alien had been knocked out of his seat and was being jostled about the cabin . But he was moving now, on his feet, and it looked like he was supposed to be walking forward, but instead he was moving backward.

"Just Beat me, just Beat me...." he murmured.

I started reaching for my hand-phaser, slowly and cautiously. He spun around and stopped so abruptly I thought the gravity simulators were off line.

"You wouldn't happen to have any peanut butter and bananas lying around here, would you?" he queried.

I screamed and hit the floor, grabbing my weapon. But the Prince (God help us) slid over to me like a greased proton beam and wrenched it from my hand.

"So, you figured it out, huh?" said the Prince.

I stared at him, aghast. He just smiled that weird-smile of his; it was like something out of an old beach flick.

"Yeh, it's me. One of my daddy's old fans set me free from the suspended animation chamber. And wouldn't you know it, after my daddy, Michael, and my momma, Lisa-Marie, hid all the Terran currency some years ago after collecting it from owning rights to just about everything (gasp); I'm quite rich! But I thought it would be nice to put some Thriller into your life by stealing your ship."

He started to laugh; it was a ghostly, haunting laugh, and made him throw back his head. I took the initiative and pushed his skinny 80-pound body across the floor, slamming him into the bulkhead. But he quickly recovered, and raised the phaser. Click.

"Shoot!" he exclaimed, wrenching off the battery cover, the SupraVolts falling to the ground.

I sprang forward, slamming my fist on to the escape pod eject button. The small section of the ship he was in closed off and spewed forth into space, taking the demon-spawned love-child with it. I made a silent prayer to a certain bass drum-toting pink bunny.

Collapsing on to the console, I heaved a sigh of relief. I sat up, entered some random coordinates, and warped into space. The war was getting bigger.

It was much more intense. I was going to get my fair share of the...

FINAL FRONTIER II

(Final Frontier I was just a teaser...)

* * *

Think you're bad enough to survive this NEW, VASTLY IMPROVED version of Final Frontier? No longer do you have to wait for the wusses on your board to show up and play. No longer do you have to depend upon your teammates like in S.E.E. (Shameless Plug). Want to see if you are TRULY bad enough to hang with all the pros? It's a whole new game, networked and armed to the teeth...

You know the old story...

"This is where you come in to play. You have been given a ship
and some vessels; the most that your government could give you in
this deep space area. You must, either by yourself, or with the
help of others, control at least 400 of the planets in the Outer
Rim to win this war. By colonizing and fortifying planets, you'll
be able to manufacture more goods and ships for yourself. You should
expect aggression from other ships and planets, and should not hesitate
to attack others to reach your goal of 400 of the planets. Good luck.
You'll need it.

Now live it! An expanded, networked galaxy awaits you, along with many players from all around the universe. So get ready, read the docs and new features, then let's get down to some serious arse-kicking!

See you out there in CyberSpace, friend...

Portfolio only lasted 2 hours or so while powered up IIRC. The battery
life was good for strictly pim purposes. Of course it crashed now and
again erasing all your data which is exactly what you want from a PDA..

I have a Sharp Zaurus SL-C3000 now. Very different animal and only about
200 times faster ;)

Thanks,
Mark

I googled and every site I hit went along the following lines:

"The unit is powered by three AA batteries, which last about 100
hours."

"* 30-40 hours on 3 AA batteries (about 6-8 weeks of normal use)."

So I dunno. Anyone here actually own a Portfolio and can testify to how
long the batteries last under normal use?

PS Coolest thing I did see was that the Portfolio gives a low battery
alert, the batteries can be switched out without losing data, and since
its only 3 AA batteries, its dead easy.

I might be recalling wrong. It's been a long time since I sold my pofo's.

Thanks,
Mark

Hi, Ronald!

RJH> So I dunno. Anyone here actually own a Portfolio and can testify to
RJH> how long the batteries last under normal use?

I used to power my PoFo with rechargable batteries (lower capacity than
alkaline batteries at that time plus memory effect) and they lasted for
about three weeks.

RJH> PS Coolest thing I did see was that the Portfolio gives a low battery
RJH> alert, the batteries can be switched out without losing data, and
RJH> since its only 3 AA batteries, its dead easy.

Right, that's a really nice feature :-)

Hey, thanks for the heads up. Some of us were wondering just how long they
lasted.

> Right, that's a really nice feature :-)

Dead handy, I'd imagine.

RJH> Dead handy, I'd imagine.

The point to me was that even though the PoFo was on low batteries there still was enough time to recharge the other set of batteries - if in "suspended" mode as one would call it these days...

Yes, but you do the RIGHT THING !!! Save the PLANET and STOP USING ALKALINE BATTERIES !
USE RECHARGEABLE GOOD BATTERIES (Ni-MH with 2100mAh!).
Thanks for the planet and the next generations !!

Think about that :
- if put into earth, 1 alkaline battery is contamining 1 cube meter of earth for 50 years long !
- if burnt, it is very bad for air !

>> PS Coolest thing I did see was that the Portfolio gives a low battery

Hi, Rodolphe!

RC> Yes, but you do the RIGHT THING !!! Save the PLANET and STOP USING
RC> ALKALINE BATTERIES !

Something like that was my intention when I decided to use rechargable
batteries.

RC> USE RECHARGEABLE GOOD BATTERIES (Ni-MH with 2100mAh!).

I did not use the PoFo for a long time now, but you're right, capacities
have multiplied since then..

RC> Think about that :
RC> - if put into earth, 1 alkaline battery is contamining 1 cube meter of
RC> earth for 50 years long !

Nice to know, I did not think about that in detail. In Germany batteries
are considered hazardous waste, but even that is deposed somewhere and
might turn into a source for trouble in future...

Regards,

Alexander

6452. Frodo/F030 (CT60/3) port updated

Newsgroup: comp.sys.atari.st
Date: 2006-04-07 11:45:34 UTC
From: PeP <pep.fishmoose@gmail.com>
Message-ID: <1144410334.586384.46870@v46g2000cwv.googlegroups.com>
Source record: 8829

Howdy ppl,

I've updated my Frodo port. Frodo is a portable C64-emulator originally
written by Christian Bauer.

Requirements:

- CT60/CT63 (Maybe AB040?)
- VIDEL-compatible graphics (F030)
- Joypad or joystick
- patience (there is no GUI yet)

Features:

- integrated debugger
- sucky sound emulation (uses YM atm)
- 60FPS operation (on my machine, at least)
- joystick/joypad support

It's been tested successfully on a CT60 (90/25Mhz), running
FreeMiNT/Xaaes (latest alpha). It should work in
TOS/MagiC/Naes/MyAES/Geneva too, but I haven't tested it.

Grab my port here:
http://hem.passagen.se/shoggoth/frodo

Original author:
http://frodo.cebix.net/

It really is a shame that we have been polluting (killing) the planet
for the last couple of hundred years or so. What most people don't
realise (or don't want to face) is that its much too late. There is
nothing we can do now to prevent the earths gradual (or cataclysmic)
demise. We are all guilty of this so i'm not pointing any fingers, just
stating what I believe to be fact.

Happy thoughts eh? :-)

Did'nt Grundig invented the bio-battery? You could throw it in the
Trashcan. Without quicksilver, so far I remember!

Best Regards,

Daniel Mandic

The Time, when nothing anymore is.

I have here Z80, 6502, 6510, 80286, 68000, 68030, 80386, 80486, 80586
and even a new modern 80686, all magazined sortly and in order. Let
them come :)
I am prepared. Two or more boxes (32Inch TV-SET cartons :-)) full of
Games, I played 25%!! Not to mention the 'abandoned' copyrighted
Software, from the best programmers of that time.

Kind Regards,

Daniel Mandic

http://tinyurl.com/lnyxv

Going thru my boxes I found these, I don't use them and so hope someone here will enjoy them as much as I used to. I have some other stuff like the Atari Brand 20MB hard drive and a new 1040ste and will eventually list them. I'm moving and taking the opportunity to lighten the load especially since I don't see myself using these in the future. The PC has been taking up my free time lately.

Hey. AFAIK, the maxium speed on a stock Mega ST is still that of the
standard serial port on any ST model. In other words, 19.2k...

It can be sped up with -hardware-, like the RSVE mod.

HSMODEM software corrects bugs 'n uses faster routines, but doesn't
actually speed up the stock serial port (unless you count not being slower
because of re-transmission errors n' such).

Hi, Coda!

C> We are all guilty of this so i'm not pointing any fingers, just stating
C> what I believe to be fact.

Sad but true. The point is that most people don't care at all. This
attitude partly is enforced by our "modern" meritocratic society. If you
want to be successfull you have to be fast, i.e. you have to squander
ressources and implicitly to produce waste.

Globalisation is another aspect that is closely related to the stuff
above.

C> Happy thoughts eh? :-)

Erm - No! :-/

Regards,

Alexander

Folks, we've had really severe weather here in the last 24 hours.

(tornadoes, high wind, intense rain, cats and dogs-living
together...<cough>, er wrong movie...) :-)

Anyways, we were without power for much of the last 24 hours. Which far
exceeds the UPS I've got on the BBS.

Our normally stable dynamic IP address changed, one of only 2 times its
changed in over a year.

Its now: 24,177.23.112

Until my server gets this updated, you'll be unable to telnet to
"bbs.darkforce.org" although the actual IP address will work.

Thanks for your patience and sorry for any inconvenience.

Hi all,

A new set of XaAES binaries are yet again available, and this time the appearance is in focus!

*The object renderer can now draw textured backgrounds in =>256 colour modes. Textures can be applied to window widgets, menus/popup menus and 3d-objects.

*XaAES can now also draw nice gradients to provide some eye-candy to eg. window title backgrounds and the likes.

*The way XaAES handles/arranges iconified windows has been improved a lot and can also be configured in great detail

*As usual, a lot of fixes and adjustments where you\'ll for example might notice that the taskmanager now can be accessed even when wind_update() has been locked

+Loads or smaller fixes and adjustments. Have fun!

This XaAES development snapshot is integrated in MacAranym 0.9.3 at

<http://eureka.atari.org/MacAranym.zip> for OSX

as you can see in the <http://eureka.atari.org/aranym.gif> picture.

It is also part of <http://eureka.atari.org/xa-my-aes.zip> that
is a boot disk image designed for all ARAnyM's host machines.

Thanks for the great work done on freeMiNT+XaAES, and all other
softwares that are included in those packs.

Greetings,

Top posting and wasting electrons

Yes, I have and use a Portfolio, and every three months or so, it tells me
the batteries are low, so I change them, using the spares that live in its
case until they are needed. Once and once only it crashed, and I had to
retype a few words. There is, untried by me, a program named uncrash.com.

Jim

We're offering all the latest factory pressed high quality dvd movies, ps2, psp and xbox silvers with factory printed colour inserts at fantastic prices, whether for personal use or reselling. We're shipping worldwide with various shipping methods. For resellers, please contact us for bulk discounts.

For a complete list and prices, please email us at movieworld@time.net.my

(Please state the type of list that you want and tell us your location as the prices varies for different locations. If you're reseller, please state the quantity you wish to order per shipment and we'll quote you a wholesale price depending on the quantity ordered.)

* If you need references, we can provide them to you.

6472. Noise Party Last Reminder!

Newsgroup: comp.sys.atari.st
Date: 2006-04-10 09:20:35 UTC
From: mikro <mikrox@atlas.sk>
Message-ID: <1144660835.182003.133710@g10g2000cwb.googlegroups.com>
Source record: 8749

Hello scene friends,

so our dream becomes reality -- Noise will happen in less than week!
This is last reminder from us, we've got some additional information:

1. Prizes

Yeah, as we promised, we've got sponsorhip for the prizes so here you
are! It's guaranted we can give you at least:

- 1 x 17"LCD
- 2x 1GB MP3 players
- 1xHDD
- 1xDVD
- 1-3 "small" MP3 players
- 9x Eiffel v4
- 1x external DSP clock 44.1 kHz for Falcon
- Atari T-Shirts, Noise T-shirts, Atari cups, packs of 5.25" disks and
some others atari souvenirs
- and of course: cash! Everything we've got from entrance fees will be
used for winners! See Noise homepage for more info!

As you can see a trip to Noise could be pretty profitable ;)

2. Security

Don't fear to bring anything you want! We hired a professional security
guys! They will guard our stuff all the time!

3. Additional goodies

Believe or not but thanks to our sponsor we could arrange something you
wont see at other parties! Free bowling and food on saturday! Yes, we
plan not to only be closed in one hall but we think it would be nice to
relax a little bit so we prepared this action for you! Again thanks to
our sponsor!

4. Last info

Don't forget usual things (sleep bag, money, atari stuff, good mood
...) and don't hesistate to contact us in case of some problem! Tomorow
we are going to update "Traveling" section (how to get at Noise from
bus station, railway station etc)

So, at the end, we'd like to invite you once again... remember this
party is one-go action, there wont be any further Noise volume. We did
all our best to make sure you wont bore and you just really enjoy our
party. We set entrance fee at the lowest possible boundary (compare

with this year's Outline -- 45/55 Euro vs 15 Euro!), we prepare many cool events and competitions so... it will be *really* worth to visit it.

Don't miss this chance to meet with the folks from 8/16/32bit scene, the chance to see the best demos from all atari platforms, the chance to see some rare atari stuff and of course -- to meet a friendly guys and have a good time!

Regards,
Your Noisy team
http://noise.atari.org

See you in Slovakia!

Message-ID: <Xns97A1E1B9BBB74skdjhfqsnb@212.27.42.206>
Source record: 8751

Hi All,

I found a lot of old Atari stuff in the attic, so I am now unloading that
to make room.

Hopefully someone can be interested in the following,

ICD Link2 (tested)
http://cgi.ebay.fr/ws/eBayISAPI.dll?ViewItem&item=8794564908

Spectre GCR - Gadgets by Small (no floppy cable)
http://cgi.ebay.fr/ws/eBayISAPI.dll?ViewItem&item=8794564924
(the manual itself is a masterpiece of hacker genius IMHO)

AT/Speed (turn a MegaST into a genuine 286, ain't that great ! :)
http://cgi.ebay.fr/ws/eBayISAPI.dll?ViewItem&item=8794564883

Items are in France but can be shipped to Europe or the USA (shipment
charge to be adjusted accordingly).

Any questions or remarks, please email me at
armadillo2024 at free.fr

Cheers,

Fabrice

From: Mark Bedingfield <mark@nomorespamplease.computercom.com.au>
Message-ID: <KEE_f.3992$vy1.789@news-server.bigpond.net.au>
Source record: 8754

Afternoon all, decided to have another whack at Xaaes. So far so good. I used Easymint/Xaaes 963 and then installed the latest version of Teradesk. That works fine. Now I am up to installing Xaaes' latest build. So that should be a challenge. Last time I tried it, was a disaster. So far so good tho.
A few questions tho, resolution changes under Xaaes is there any easy way to get 800x600@256 colours or 640x480@65536 colours? I am using a towered Falcon/CT2/NVDI5. I have the flags set for 640x480@256 colours atm. Desktop piccys and other eye candy? Is everyone using Thing? Can Teradesk do it?
I keep getting a Wdialog error from Cops when firing it up as well using Xaaes/Teradesk. Any ideas there? For now I have reverted back to Xcontrol. What/where is the definitive forum for such things? Is there an end to world hunger? Is there intelligent life in outer space?

Any answers to the simple ones would be appreciated;-)

Cheers

Mark

0.963? That is the old program version of the AES, right? (xaaes.prg or
so?)

>
> build. So that should be a challenge. Last time I tried it, was a
> disaster. So far so good tho.

Oh? What happened then? Did you attempt installing the XaAES kernel
module then?

> A few questions tho, resolution changes under Xaaes is there any easy
> way to get 800x600@256 colours or 640x480@65536 colours? I am using a
> towered Falcon/CT2/NVDI5. I have the flags set for 640x480@256 colours atm.

XaAES can only use the resolutions available via the VDI, which means
you need to know how to configure your screen-enhancer. If you let us
know what you use we may be able to help :)

> Desktop piccys and other eye candy? Is everyone using Thing? Can
> Teradesk do it?

I use Thing most of the time. But since I started work on real themes,
the AES object renderer part, I found that Thing uses progdef's (a
special AES object type that makes the AES call user-functions) to draw
own AES objects. Effectively killing the idea of themes. I'll try to
contact Thomas Binder regarding this. I think Teradesk is clean in this
respect, but I havent dont extensive tests.

> I keep getting a Wdialog error from Cops when firing it up as well using

What errors do you get? And the correct forum for XaAES discussions is
the forum on xaaes.atari.org :-)

>
> Any answers to the simple ones would be appreciated;-)

Hope the above did the trick ;-)

Best Regards,
Odd Skancke

Yes. I did it last year. I can't recal exactly what happened but it
failed and I hadn't backed up my boot drive. I have now;-) I suspect it
was me being in a hurry again, and not spending enough time RTFM.

Wdailog needs to be run... or something along those lines. I suspect it
is because I am starting it from the Auto folder rather than mint.cnf?

And the correct forum for XaAES discussions is
> the forum on xaaes.atari.org :-)

I'm on my way. Thanks.

There is absolutely no connection anymore between the kernel module and
the old program version of XaAES :)

Okie, I think that if you ask questions on the XaAES forum found on
xaaes.atari.org, you will get answers :)

Never EVER use Wdialog.prg under XaAES! wdialog is a hacked hack which
will render a FreeMiNT/XaAES system unstable. XaAES have own
implementation of most wdialog functions.

I think the reason why there are pagues every now and then... mother
nature tries to clean up a bit when there are too many who needs to eat.
However, we've 'mutated', so the world is like a body whose immunesystem
doesnt stand a chance...

Best Regards,
Odd Skancke

Hello, Edward!

ESBJ> Is there a good program that will display ghost files so I can
ESBJ> delete them?

What kind of files do you regard as "ghost" files?

- hidden or system files?
-> most desktops can be configured to show them
- damaged directory entries?
- "files" allocating space (in the FAT) but having no directory entries?
-> here I'd propose tools like Diskus or simple disc monitors

Regards,

Alexander

Control Panels

Please run the system extension WDIALOG, which is supplied with NVDI, or
use the multitasking sytem Magic4.

I have disabled it, but no change.

Hello,

Two small fixes this time:
- '@' character is not usable in GEM configuration dialog for TTP command
line, fixed.
- Also reserve 256 KB ST-RAM as default instead of 128 KB.

A friend of mine has a 1040STf with a problem regarding the internal floppy. I don't know what he did to it, but almost 2 years ago when we had to move and the ST went to his apartment (long story how it was his, but I had it at my house), and when I set it up, it worked fine. Then he moved it to another room some time after that.

Now when he turns it on, the drive makes a noise, it does indeed spin the disk, but as I observed, the drive moves the head(s) back and forth, then at some point the desktop gives up and displays 2 drive icons and the Trash icon.

The disk in question used to boot up with a boot sector and virus detector thingy, then load a mouse accelerator, then load the desktop inf file, then go.

I tried another drive but the drive was dead, so I'm going to try one more drive that I can think of before I have to give up and tell him to buy a replacement. When I tried the apparently dead drive, the desktop wouldn't even come up with any drive icons at all.

The 1040STf is stock with absolutely no modifications. I hope there's no problem with the section of the power supply for the drive. I wonder if he dropped it or something while moving things and just won't admit it. At any rate, I figure it'll cost him about $50 or so for a new internal drive. It's got an external drive that for all I know works.

If the drive has a speed control thingy that I know is in the drives for the Atari 8-bits, I don't know where it is. I don't understand how this thing went out of spec just sitting around. I don't recall the internal drive making a noise before, so he's done something that FUBARed it.

Any help on what could be wrong, good info on relatively cheap(er) priced replacements... replies here are probably what will happen, or you can email me directly (sorta preferred).

I managed to replace the internal drive on my 1040STf that yet another friend has with another 720K mech, but I don't count on finding those anymore at HAMfests for $5. ^.^

Later. and thanks.

Maybe try formatting a blank disk after the ST has crawled it to the
desktop. This may identify a dead drive. The other (less than
conventional) solution would be to give the ST the 1inch drop but if you
have it open already just push all of the chips in one by one.

You did of course make sure that the ribbon cable was plugged into the
replacement drive the right way round? Ataris are odd that way!

Also you need to reconfigure PC floppy drives to be ID0, they're
normally set to be 1.

Hi Andrew,

AF>I figure it'll cost him about $50 or so for a new internal drive.
that seems very expensive to me. I think 15 Euro (~20 US-$) should do.

Almost any PC flopy drive will do. Maybe the drive is to be jumpered
half-size (720 bytes instead of the PC's usual 1.44Kb). I recommend
Epson or Chinon, but I don`t know if these brands still exist nor
produce floppy drives, for most PCs are delivered without floppy
drives.

AF>If the drive has a speed control thingy that I know is in the drives
AF>for the Atari 8-bits, I don't know where it is.
I don't think you can control the speed that has to be 300 rpm.

AF>Now when he turns it on, the drive makes a noise, it does indeed spin
AF>the disk,
That means power is there, no doubt.

AF>then at some point the desktop gives up and displays 2 drive icons and
AF>the Trash icon.
That's quite normal and means that no readable disk has been found.

I'd do the following: Format a disk on any computer, PC or Atari don't
mind, for the 720 format. Leave it empty and give your drive another
try. Then you will get the known desktop (two drive and one trash
icon), change the desktop (add another icon, move one icon...), save
the desktop, that will give you one new file (DESKTOP.INF) on the
empty disk, and reboot.

If the new desktop appears, all but your original disk is fine. If
not, you really have a floppy drive problem.

Any normal 1.44 PC drive will work if you change the ID select.

No desktop icons is normally a deeper problem witht he drive, plugging the cable in the wrong way can do that. oh and of course 1.44 drive actually need the cable plugging in backwards so you may have to do some plastic snapping to get it to fit.... Not all 720k drives will be set to the correct ID....

looking at the other posts here... Didn't Alison do a document about drives and mods ?

should this guy do more diagnostics?
why doesn't he use sys-info take paremeters into account ,then save tos img
with tos.ram
then load into emulator and compare tos from his computer to tos from
emulator ... at this point i ataris do that ,make little sound before
reliezing no boot disk but analysing more could direct to further
trouble...psugesting internal circuit defect or something.

Ello you :)

Mmmm, yeah, sort of wrote something but never finished it. ang on..
http://www.retro.dial.pipex.com/fdcompat/stfdds.txt Now I don't want to
hear any criticism or comeback on that as it's just something I toyed with,
everyone can sod off!! :)

Easiest way for the OP is trial and error. If the original drive is a
double sided and it's failed, it may just format single sided disks on it's
way out.

I bought a new floppy for my Hades from ATY Computers. It works great, but it
cost me around $70. Still, it was worth it.

Hmm, not even constructive criticism? ;-)

It's an interesting doc, but the ascii tables dont line up in my
browser <ducks to avoid flying tableware> though its easy enough to
read.

Thanks for publishing it :-)

Hi Edward!

>I can get the BoxKite file selector to display, but I cannot delete
>them.

If you have Diskus (or perhaps SED), you can enter the directory and
rename or delete the files by directly editing the directory entries.
But caution, it's quite easy to do great damage to your data if you
don't know exactly what you are doing!

With best regards
Ekkehard

Hey, thats great. Thanks for not having a fit! :-)

6507. AtarICQ 0.168 is released

Newsgroup: comp.sys.atari.st
Date: 2006-04-15 21:46:53 UTC
From: GokMasE <gokmase@gmail.com>
Message-ID: <1145137613.509418.28480@v46g2000cwv.googlegroups.com>
Source record: 8784

Hi all,

Following the recent progress in XaAES, aICQ is now available in a new release where some things have been adjusted to work and look smoother together with XaAES. For example, aICQ is now rendered okay also when the AES draws textures as background on 3d-objects. In addition to this, the tabs has been equipped with a discrete 3d-look that should kick in if you run AtarICQ in >=256 colour mode.

Users with scrollwheel mice might be interested in knowing that aICQ now responds to WM_ARROWED, and also supports XaAES WHL_AROWWHEEL mode causing in which the AES sends extended WM_ARROWED messages to further optimise the scrolling.

In addition to the above, a couple of bugs has also been found and fixed. (For more details, see below)

To skip the details, and go to download site: http://www.ataricq.org

----- New in AtarICQ 0.168 ---

* aICQ's message window is now tweaked to look at its best when the dialog background is using a bitmap texture. As a result of this, the feature to configure the background fill colour from within the preferences has been removed. If you wish to tweak the background colour to a solid fill colour, you should however be able to do so using your favourit RSC-editor.

* Small adjustment made to popups, fixing appearance under latest XaAES.

* Scrolling behaviour changed slightly: When the slider is not located at its bottom position, the text will not scroll to bottom when new messages are coming in. If located at bottom => follow bottom.

* In addition to the above, aICQ will now need the slider to be located at its bottom position in order to consider messages to be read.

* The TABs in the message window are now equipped with a discrete 3D-look when your setup can use >=256 colours. The active tab will also be enlarged slightly to further allow you to distinguish it from the unselected ones.

* AtarICQ will now redirect WM_ARROWED messages to the vertical sliders in both contact list and message window. When a mouse scrollwheel is rotated XaAES sends WM_ARROWED messages even to windows that don't have a native slider. This means that at least

under XaAES you can now use your scrollwheel to scroll inside aICQ
windows. AtarICQ also supports XaAES extended scrollwheel messages,
using the WHL_AROWWHEEL mode.

* A bug that would cause display problems in the text input field in
the message window has been fixed. It would only hit if the user had
installed a custom system font, which had different char width/height
than the original Atari font. Should be fixed now.

* Discovered a nasty bug that would cause very bad memory corruption
upon certain incoming messages. The reason was that certain clients
are using a single ascii-13 to indicate a rowbreak.
Should be fixed now.

Regards,

/Joakim

Hi all,

Since a couple of somewhat serious issues in latest alpha release has
been found, there is now an alpha update available for you to download.
It also has a couple of new additions. These are the most important
changes:

* Fixed bug causing COPS's CPX windows to disappear right after
opening.

* New AES keyboard combo, CTRL+ALT+P, will restore palette to system
default in colour modes 256 or less.

* New AES keyboard combo, CTRL+ALT+D, make a snapshot (needs external
app, see readme.txt)

* Fixed a glitch where using CLOSER widget to close Taskmanager window
released all information it contained.

* Taskmanager showed selected entries as black text on black background
- fixed.

+even more fixes. See docs for details.

http://xaaes.atariforge.net

Regards,

/Joakim

Lol, we share a lot of coloquilisms. I live in Melbourne tho, so you are forgiven. But I will never support the Wallabies. Go the All Blacks. I dunno 20 million people and the can't even get a decent Rugby team together ;-).

BTW the latest Xaaes updates work a treat. Fixed heaps of niggly problems.

Mark

Hi, Edward!

EF> If you have Diskus (or perhaps SED), you can enter the directory and
EF> rename or delete the files by directly editing the directory entries.

But before you do so you should check wether the directory entries are
related to a (trace of) allocated data clusters.

Or even better: Let your tool check the integrity of the file system...

EF> But caution, it's quite easy to do great damage to your data if you
EF> don't know exactly what you are doing!

Right, if you don't utilise advanced functionality of your tool then
it's almost essential to have the background. Any sector monitor software
that I have used so far gives appropriate warnings at least...

Regards,

Alexander

See my other post... Alas, checking the QL directory, I'm not too sure how
good the site is...
I just tried a couple of the zip files there, and they both came back
broken.
(I think he screwed up his encoding on the page and marked them as text/html
or something, downloading in forced binary mode didn't help either)

Back in 1999, when Rich Sanchez closed official support for BBS Express! ST, he released a final version into the public domain. I don't have a copy of this release but would love to...

I've been trolling the Atari FTP sites (Belgian, Umich, etc) for the last month and have been unable to find it. I've been looking in Networking, Modem, BBS, etc,... I've also downloaded the index files from these sites and searched them. No luck.

Does anyone know where a copy of this release can be found? Any/all help appreciated. Thank you.

Just checked, there were some broken archives in some of the sub directories
for that machine, removed 'em - will restore later from another backup.

cheers,

Lance

Hello all;

On 11 Apr 2006 08:06:35 , Odd Skancke wrote:

> 0.963? That is the old program version of the AES, right?

I would like to note that this seems to be probably the last version that works correctly on ST-series computers. It does not appear to be a matter of insufficient memory (e.g. a 030 version of xaaes can be run on a 4MB TT)- but the '000' XaAES binaries of newer releases invariantly seem to crash at startup, with 'illegal instruction' faults. Have these binaries ever been really tested on MC68000 machines?

>XaAES can only use the resolutions available via the VDI, which means
>you need to know how to configure your screen-enhancer. If you let us
>know what you use we may be able to help :)

Odd, do you intend to implement resolution change into shel_write() function in XaAES? Then at least the 'standard' Falcon/ST video modes would be easily set, e.g. from TeraDesk, and the screen enhancers should then probably work as well. As XaAES already can change to 'standard' video resolutions from the task manager, it would probably be an almost trivial matter to enable it through shel_write(), wouldn't it? Now that newest MyAES supports such call to shel_write(), XaAES is the only AES V4 left without this capability.

>> Desktop piccys and other eye candy? Is everyone using Thing? Can
>> Teradesk do it?

No, TeraDesk can not draw desktop background pictures and there are no plans to implement that. Personally, I think that desktop pictures are in fact distracting to the user, and a waste of system resources. However, it would probably be possible for an interested party to code a separate utility that would insert a background picture into the root screen object. MyAES contains a background-picture capability, though not as a separate module.

Btw. Mark, I saw in xaaes forum that you inquired about restoration of the palette after some old ill-behaving programs. Try setting the 'Save palette' option in Video options of TeraDesk. It has two effects: 1) the palette is saved at program start and restored later, and 2) the palette is saved and loaded together with desktop configuration file. It may happen, that you may have to set the particular misbehaving program as 'no multitask' in TeraDesk in order for this palette restoration to work (please tell me if it works).

> I use Thing most of the time. But since I started work on real themes,

>respect, but I havent dont extensive tests.

TeraDesk -may- use progdef objects for drawing some elements in dialogs:
various button types and dialog titles are drawn as progdefs -only if- TeraDesk
concludes that an AES does not know of them (i.e. if appl_getinfo() about
understanding WHITEBAK flag is negative). Through an environment variable
one can force the use of these progdefs, if desired. Also, at least some
FTEXT-type objects in TeraDesk are always drawn as progdefs (e.g. scrolled
editable fields for long names).

>Is there intelligent life in outer space?

Possibly, though on planet Earth it has not been found so far.

>And the correct forum for XaAES discussions is
>the forum on xaaes.atari.org :-)

Btw. I tried to register to that, and got an information that I would be
sent an e-mail shortly, to tell me how to activate the account- but no mail
ever came. Any suggestions?

regards;

Djordje Vukovic

Odd has added the ability to restore the palette using 'Ctrl+alt+P'
works great. Will give your trick a go too, thanks.

6529. Latest version of PeST on the way, colour heatshrink?

Newsgroup: comp.sys.atari.st
Date: 2006-04-19 18:08:04 UTC
From: techie_alison <retro@dial.pipex.com>
Message-ID: <ELWdnUd0AZGb5tvZnZ2dnUVZ8qKdnZ2d@bt.com>
Source record: 8706

Hello,

Just took delivery of 180 new PCBs today, the other 120 or so went over the last 6 months. Thanks to all those that bought and who are reading this.

This is the new version of the boards, much much smaller using SMD components this time; http://www.retro.dial.pipex.com/Pest_040/pest_040.jpg

There's still some of the larger PeST left on eBay at the moment; http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=8794824308 If you did want one of these new small ones just bid and let me know which to send, there's about 10 watchers there at the moment but will relist as I don't think the 3 will sell in the final moments.

In some ways Chris and I are finding it mildly amusing reading some of the other Atari forums where someone will slate PeST and go off to develop their own PS2 interface shouting about it all along the way, which ends up with numerous components, capacitors, crystals, and then you have to build the thing yourself. PeST is the smallest, neatest, simplest that you can get. High praise is given to Eiffel if anyone wants to jump in there, although you can't just 'buy' it and have it two days later.

What colour heatshrink should I use for this new PeST??? Red? Yellow? Green? Blue? or stick with Black?

Aly x

An even more elegant solution to the Atari mouse issue. Thank you for
your efforts.

> What colour heatshrink should I use for this new PeST??? Red? Yellow?
> Green? Blue? or stick with Black?

Atari grey would be best. If you want to be fancy, how about
stenciling a multi-colored fuji on white? ;-)

Galen

I bought and am well satisfied with the old version. It's never caused a
problem from day 1. Can't ask for more than that. WHo cares about cosmetics?
I don't. If it works, that's good enough.

Hi Galen,

Just picked up the heatshrink, we're going multicoloured. Will just do
these at random I think unless anyone has a preference.

Brilliant to hear that you're getting on well. It's a personal reward
somewhat to see the thing all over the world, I've finally achieved
something and helped some people out!! :) Yayyyyyy!!!

You know, I'm tempted to do these new ones 1/2 price for any of the existing
users, not a sales gimmick mind, more to look after the people who believed
in me. Also I've done it in such a way that if ever I update the firmware I
can re-flash old PeSTs on request. Only issue I've ever found is with one
TT, haven't a clue what it is, still sorting that one out with a Logic
Analyser right now, guy has offered to pay for the extra PeSTs but I stick
with how I would like to be treated by someone selling me something.

Thanks so much to all, you've cheered me up in life a little bit. :)

Aly xx

It is broke up, but easy to grab 'n paste into a browser.

I tend to like darker colors personally, so gray, black, etc, looks
alright, but I do like the other posters idea of a fancy Fuji branded
white one... :-)

Okay, I just extracted it and glanced through it quickly.

So...the source code is -not- included? I had hoped it would be there, so some minor updates could be done. That date error is the worst thing, right off hand. Accepting (built-in) speeds higher than 19.2k would be nice as well.

Guess I'll keep on dreaming.

Hey LP!

I think you're referring to HSMODEM and on the hardware side, the RSVE
serial port upgrade.

Those are very good from what I've seen, but I'd just like to have Express
do it itself, ya know?

Can't have everything though, I guess. :-)

Yeah, but at least I know I'll actually have a PS/2 mouse interface
IN MY HANDS. I hope the other interface does get done, so I don't
have to give any more money to that crook Chris Swinson at CPS
Electronics who stole almost US$100 from me.

Ali, contrary to the glowing reviews, you also have 3 pissed (pested?)
off and unhappy customers here who still do not have the 3 PeSTs that I
ordered last year.

I wish I could write a glowing review for the PeST (which sounds like
an excellent product), but this ordeal has left a bad impression on
this project. I supported the PeST project from the very beginning
when this was first announced. I enjoyed reading the updates on your
progress and seeing the extraordinary progress being made. It was great
excitement to see it done, so I supported your efforts by pre-ordering
the PeST through the CPS Electronics web store (since they were taking
care of the international orders, and so that PCBs can be ordered at a
good price).

When the shipment didn't arrive for well over a month, I contacted
Chris at CPS on the status. He said he would check up on it. So I
waited another couple weeks, and I even went to the Post Office to see
if they had it by chance, but no luck. I then asked Chris for an
update. He asked if I ordered it with tracking. Huh? The shipping
rate included tracking, right? Nope! He said it would be too much
trouble for him, so he sends my US$100 worth of merchandise to me using
standard (read: CHEAPEST!) shipping rate. What the F***?! Who would
send US$100 worth of product overseas without any tracking?!
Apparently, Chris. And, he did this WITHOUT informing the customer -
me! Note that I would have gladly paid extra for shipping with
tracking if Chris would have stated that the UKP2.50 shipping that was
AUTOMATICALLY tacked on to any PeST order was only for standard
shipping. However, he DOES NOT LIST any other shipping option!!!

Unfortunately, he continues this DECEPTIVE shipping cost practice
today. Check out the website yourself at http://pest.atari.org . It
STILL DOES NOT show what shipping rate he uses. He still does NOT state
that he uses standard postage (i.e. the cheapest rate!), and he still

does NOT state that one must ask him if they want to use a shipping rate with tracking.

Really, how does he expect INTERNATIONAL customers to know what the shipping rates are in the UK? From his messages, he sounds like a strict businessman yet he doesn't have the business sense to make sure the INTERNATIONAL customer is given a choice of shipping options, or to make sure to pick a default shipping method that can guarantee that the package will arrive at the customers' door overseas. He continues not to take responsibility for his mistake of not clearly stating the shipping method. It is be stupid to assume that most international customers know shipping rates of other countries. I bet most US residents do not know the UK shipping rates, and I bet most UK residents don't know the US shipping rates either.

Good businesspeople help their customers (especially those not familiar with the territory) to make the correct purchases. Actually, Ali, a good example is your method of selling the PeST. Your website has good information, but most importantly, your ordering page CLEARLY LISTS the many shipping options that your customers can choose to make the correct shipping choice. That is not the case with the CPS site. You're stuck with cheap shipping or nothing at all. I wish you handled international orders instead of the crooked "businessman" at CPS Electronics. To all those who did receive your PeSTs from Chris/CPS, consider yourself LUCKY.

Ali, again, I appreciate your efforts to the Atari community and the PeST sounds like an excellent product, but I can't continue supporting it until I get the PeSTs that I paid for using my hard-earned money.

I know you can't control Chris (or can you? :-)), but I supported the PeST project from the beginning, and kept with the updates, and felt the excitement when it was done. I did my good deed in helping the project and the Atari community by pre-ordering the PeST. What happens? I get screwed! It's sad to see your extraordinary efforts overshadowed by a crook like Chris Swinson/CPS Electronics who steals their customers' money and uses deceptive shipping practices.

I hope you can find another supplier more honest than Chris/CPS, so that your products don't get mired in his dishonest "business" practices. You just may regain three happy customers.

- Phil

Would that work with a Mega STe and its enhanced ports? I don't have a TT
but I've got a very nice Mega STe.

BTW, did you see that last TT that went on Ebay? It had accessories, but
man...$650!

Hi Phil,

I'll sort that out, drop me a personal mail. I was loosely aware of this in
that Chris had mentioned it and was dealing with it.

If you send me your home address I'll make it good myself. Chris and I
operately separately as far as the selling goes, if you've paid for it I
want you to have them. It's more than money for me. :)

Aly

6553. TT Wont boot from HD

Newsgroup: comp.sys.atari.st
Date: 2006-04-21 18:07:15 UTC
From: blah@blah.com
Message-ID: <357i42hicn3rtaiuoo5fhrb561kkg5icv3@4ax.com>
Source record: 8730

Greetings all,

Have an Atari TT which usually has just the vanilla GEM desktop running on it. The other day I decided to boot it using MagiC which is installed on the C drive. MagiC promptly crashed the machine and I'm now unable to boot from the HD.

Tried holding C, D, E... when booting to force a boot from one of those drives but it does not work. Boots fine from floppy but can't access the "corrupt" drives. Knife ST only reports 'A' as being avalble.

HD does make a noise but the light stays off.

Anyone got any ideas on how to get back onto the 'C' drive or tools I might use to see if the HD is fried?

Thanks in advance

Dave

Not a expert on this, but have you tried installing HD driver on a floppy
and holding down ALT to force booting from floppy ? I managed to corrupt
the driver.sys on my C: drive and couldn't access my drives, if you boot
from a fresh floppy with HD driver installed on it then try acessing your
drivers.... I only used HD8 driver, you should be able to detect the drive
from there... install the updated HD driver to floppy first then you can
again boot from floppy and hopefully access your hard drive... at that point
you can install a new driver to the C: drive...

HTH.

Hi Chris,

I've got HD Driver version 6. Machine boots up with the floppy disk
but all the menu options which access the HD report 'no devices
found'. This is all from within HDDRUTIL.

There's no option or program on the disk that allows installation to floppy. Is there any reason for me booting from a "fresh floppy" as opposed to the original disk?

I suppose the HD might have died but it does seem a bit of a coincidence.

Cheers
Dave

First you should check whether your drive is recognized when running an
ID check. Only when the drive is found will a hard disk driver be able
to find any partitions on it.
In case your drive is found but no partitions can be accessed the
drive's root sector might be corrupted. Depending on how the drive was
partitioned the root sector information can either be restored
automatically by the software used for partitioning the drive or by
other tools.

Well I am just going on my HD floppy, the drivers were there but it will not be setup to "take control" of my hard drive.. So you load up HD8 from floppy and auto detect... then install the driver to floppy... when you reboot the driver is configured to read your drive so you then can access your partitions... just running the driver on its own will not work until you do all the setup stuff..

> I suppose the HD might have died but it does seem a bit of a
> coincidence.
>

Make sure it comes up when you boot from floppy that HD8 is actually loading.. then load the util prg and search for devices... by the sounds of it , if its comes up "not devices found" then it sounds like a hardware issue. Check your cables....

good luck.

Hello Uwe,

ID Check reports devices ACSI 0...7 & SCSI 0...7.1, no errors.

The drives(s) was partitioned using HD Driver v6.

Does it look like I'm looking at a corrupted hard disk driver?

Cheers

Just a thought... If the hard disk driver on 'C' got corrupted then
is there any reason I can't boot from 'D'...'F'? I've tried holding
down the keys 'D'...'F' on various boot attempts.

Magic is known to fuckup MBR (master boot record) sometimes.. It may be
the cas with you, drive is unusable until u fix the MBR. Back in old days
we did that in DOS...

only the C: drive has the driver, once the C: drive is lost the other drives
are lost with it.

MagiC is known for that? Hmm, I have been using MagiC, including beta
versions, for years, and it never destroyed my root sector.

Does the ID check report any *devices*, i.e. devices names? Or does it
just give you the list of bus names, without anything else?
Note that the ID check in HDDRIVER 8.1 is more sophisticated, and for
checking IDs the demo version of HDDRIVER 8.1
(http://www.seimet.de/hddriver_english.html) will also do. It's probably
a good idea to use the demo for the check in your case.

> The drives(s) was partitioned using HD Driver v6.
>
> Does it look like I'm looking at a corrupted hard disk driver?

First we have to know whether any device is actually found, see my note
above. If no device is found there is something wrong with the hardware.
If the hard disk device is found but no partitions are detected the root
sector may be corrupted. Current versions of HDDRIVER write a duplicate
of the root sector to the drive, which can be used to restore the actual
root sector. I am not sure anymore, though, if HDDRIVER 6 also does it
this way, because it is rather old. The manual provides information on that.

As already mentioned by others the bootable hard disk driver is usually
(but not necessarily) located on partition C:. If the root sector is
corrupted no partition data is available, i.e. the hard disk driver
cannot be loaded and booting from hard disk fails.

There is no mechanism to install a hard disk driver on a floppy, by the
way. Just start the driver from the AUTO folder (hddriver.prg is located
there) when booting or by double-clicking it.

Just wanted to add something else to this thread...

Its odd, but when I bootup in standard TOS, it behaves just like we talked
about above. The clock is off, and will return to a faulty date even if
you set it after booting up, after a short time, or whenever an app is run.

When I bootup in MINT/Thing though, the behavior changes. The clock is
wrong at first, of course, but once I set it, it then retains the correct
time until I power off.

I wonder what the difference is?

Of course, this is just another reason to use/endorse MINT. :-)

Thanks for all the responses.

Ok still having problems. I've downloaded the demo version of HD
Driver 8.1 and copied to a floppy drive.

Put HDDRIVER.PRG & the associated (?) .UPL file in the auto folder,
computer freezes when booting up. All I get to see is the copyright
message.

Runnning HDDRIVER.PRG by double clicking from a non-auto folder pretty
much has the same result.

Running HDDRUTIL I get the foloowing messages:

* No XDHI support
* No SCSI support

Once it's finished loading all the options under 'Harddisk' are greyed
out.

Menu Tools | Device check shows...

BUS0 Atari ACSI
BUS1 Atari SCSI

Then freezes up.

Tools | Autoconfiguring has the same result.

ID Check from the HD Driver 6 disk reports ACSI 0...7 & SCSI 0...7.1
with *no* descriptions.

Sorry if this is all a bit lame but there is no manual on the v6 disk,
its an original but the previous owner seems to have added other stuff
to it.

Cheers
Dave

I'm not 100% sure which software was used to partition the drive
originally. I thought it was HD Driver 6 but I've just found an old
boot disk (again does not boot) which has ICD 6 on it.

OK, this means that most likely something is wrong with your hardware.
The fact that your machine freezes might be an indication that something
is wrong with your TT, not with your hard disk drive.
I suggest that you disconnect your drive, and then run the device check
once again. Your machine should not freeze.

Happened here 2 times (v4 legal and v5 illegal) after a untrigered crash (once during booting with "system overschreiben" errror). Also i do know other ppl with MBR problems. In most cases, if not all, hdd probs started after Magic has crashed. Afaik it was also all on Falcons, but i would not give a hand in fire for that claim :)

been there, done that, several times. First turn off power. Next, do
whatever you have to do to get the drive bay loose and flipped back.
Unplug the hard drive. Put stuff back until you can turn TT power back on,
do so, with HDDriver in the A drive. Or, with ICDBOOT in the A drive. Do
what is necessary to run the boot program.

Carefully, plug the drive back in. The power connector will go part way
backwards, and make sparks. Do not make sparks. Then run the device check
program, and see if the drive is found. If so, you have a booted machine
and a found drive, and you can do something to it.

If not, you have a source of good refrigerator magnets.

Jim

I do not think that MagiC would write to the root sector at all. Why
should an operating system do that? The root sector does not containt
any data relevant for the OS, which only knows about the partition data.
The only software accessing the root sector is software like hard disk
tools and hard disk driver installation programs.

By the way, when using a hard disk driver like HDDRIVER, which offers
write protection for the root sector, one should activate this feature.
be it with or without MagiC.

Yes you are correct Ekkehard. I have done this before using HS Sentry. It works great in removing those files, but it does not work under Magic and it does not like long file names. I really hope that Anodnye will soon make Diamond Edge long-file-name compatible. Roger said that would happen soon, but he first wanted to get out the DVD version of CD Writer Suite which is just about finished.

I would boot up the TT using a floppy, run HDDriver and then edit the auto
folder of the C partition.

I have some dysan DSDD disks in sealed hard plastic case, in sets of 10 cases with 10 disks each for 100 disks total. If anyone is interested they are $20 for the 100 in hard cases of 10 each, price will include media mail shipping the whole box is a bit heavy.

Let me know if you want any, these have been stored in ac storage and I've used them myself with some astra 2001 drives which are true double density and they work flawlessy.

I rather not list on ebay so let me know asap if anyone is interested $20 shipped per box of 10 hard cases total of 100 sealed new disks. The hard cases also elminate your disk storage problems.

By chance I saw a machine that does just that on Monday, its a hand held printer where the cartridges contain the heatshrink (3:1 ratio) and I presume the ink, if you go to the Farnell website (http://uk.farnell.com/jsp/home/homepage.jsp) and enter T107M into the search you can find out more if your interested although starting at £80 its probably not cost effective for you.

This happened for me a lot too, but only on 520ST and Mega ST, never on
Mega STe, TT or Falcon. So put that in your pipe and smoke it? ;) Then
again I remember going on vacation and coming back to a crashed overheated
hard disk that was powering my BBS, so it's not 100% sure to blame MagiC
in those cases either.

Thanks,
Mark

As I already mentioned, in order to destroy the root sector contents
MagiC would have to write on this sector explicitly. But why should
MagiC contain code to write to the root sector? And why should this code
be executed rather by random?
This just does not make any sense.

6599. PeST_040 PS2 Mouse Interface Released

Newsgroup: comp.sys.atari.st
Date: 2006-04-26 16:13:58 UTC
From: techie_alison <retro@dial.pipex.com>
Message-ID: <GJ6dnXLqmaIjB9LZRVnyvw@bt.com>
Source record: 8676

Hi All,

The PeST_040 PS2 mouse interface is ready for sale on eBay;
http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=8802372433

For those that haven't heard of PeST, it's a buy it now interface which plugs straight into your Atari ST and allows you to use a standard PS2 mouse as would be used on your Windows PC. No extra bits of configuration or wires are required and the device works straight out of the box. Several scaling modes are also available to either speed up or slow down your mouse pointer.

There are about 100 users of the older PeST_030 out there, the 030 version was slightly larger and this new version is smaller using SMD components.

Delivery is available worldwide via tracked post and takes about 6-7 working days to ship to the USA, I'm in the UK.

Thanks so much to all those that bought and supported me before, without whom these new ones wouldn't be possible.

All the best,

techie_alison

Glad he can get them in the UK. Doesn't seem to be the hard plastic storage
case though.

By the way if this is the ebay item you're referring to: 8800678628

They are nowhere near my price. He is charging about $8 for 10 disks, I am charging $20 for 10 hard plastic cases of 10 disks each (10 hard plastic cases, totalling 100 disks with shipping included).

The label on the box Dysan 100 refers to it's 100% error free slogan, not 100 disks in that box it's only 10 as you can see because it's also quite slim.

I am practically giving these away since I am moving and don't want to store them in a garage where heat may get them, they have been in ac storage with some of my other collections for the longest while and I saved 2 boxes of 100 each for myself. At present I have 4 boxes of 100 each left. Sold 4 boxes of 100 already. This is a no brainer if you need disks and are in the USA.

Sense or no sense: Magic booting, report "system overschreiben" and disk is not recognisable after that. I doubt much of other apps are executed during booting. Happened to me twice and i know other ppl with same problem, in most cases after 68000 error.. I dont claim Magic itself is quilty per say, but why after crashes in TOS or MiNT i never reproduced the error? Problems with FAT etc yes, never had MBR error...

After all this started the thread:

>Have an Atari TT which usually has just the vanilla GEM desktop
>running on it. ï¿½The other day I decided to boot it using MagiC which
>is installed on the C drive. ï¿½MagiC promptly crashed the machine and
>I'm now unable to boot from the HD.

Disk was okay until crash, since OS was booted....

Also Magic (atleast in v5) didnt support file locking and deleting the active app folder and exiting app, did result in crashing and sometimes in partiton lost.. Im not telling that to dismiss Magic, im just stating what i experienced and what is potentialy dangerous to do....

I am not sure. Several days ago a problem with MyMail was reported that
appears to be a bug in AV-protocol implementation in TeraDesk. I would
like to locate and correct that first. Also, I still didn't really test
the fix for displaying size of large disk partitions.

Yep, I noticed that afterwards :) Yours are super cheap. It's certainly an adventure selling overseas that's for sure, about £7-8 here sending something that weighs 150g, mind you, once at that threshold, something weighing close to 1Kg is about £9. Untracked stuff is about £2-3.

I think people who need disks will try to look for brand new. At least it's
what I would want. Used 5.25" disks are usually percieved to be unreliable.
However you might want to list on ebay for what your disks contain on them
software-wise. That might have some interest.

"System ï¿½berschrieben" means that the binary code of MagiC was destroyed
by a process writing to MagiC's internal memory.
Note that you can prevent this by using the MAGTOROM software (TT and
Falcon only) which can be downloaded for free from my website.

Yes, i was using that and it did fix the problem... Im not using Magic anymore, but would suggest users to use MAGTOROM, and to be carefull when deleting files, especialy folders of an active app, since it may lead to potential data loss.. (usualy deleting folder of an active app is an error, mistake in a hurry etc...)

6627. Stock Falcon

Newsgroup: comp.sys.atari.st
Date: 2006-04-28 18:53:41 UTC
From: Joe Iron <vas.jozsef@karatnet.hu>
Message-ID: <1146250421.903187.58690@g10g2000cwb.googlegroups.com>
Source record: 8604

What are the sympotms of a stock Falcon if the clock patch is not
installed? Are the modifications on the CzubaTech site are recommended
to do or they only just CT60 specific?

Thanks

6628. Re: Stock Falcon

Newsgroup: comp.sys.atari.st
Date: 2006-04-28 20:12:00 UTC
From: Rodolphe Czuba <rodolphe.Beurkcaca.spam.czuba@free.fr>
Message-ID: <44527715$0$29491$636a55ce@news.free.fr>
Source record: 8605

The modification on my web site seems to work fine on stock falcon...
It is :
- 33 ohms resistors on R216, R221 & R222 (some sotck falcon have 0 ohm on R221).
- 68 ohms resistor to ground as line terminator on the SDMA clk trace juste before the entry of the SDMA clock pin

The 74F04 or 08 modification is not recommended for CT60/63, even at 16 Mhz falcon bus (not boosted).

Regards

Mine symptoms were random SCSI locking when transfering more data..
Locking was also connected with DMA load, so if i used higher resolutions
in more colors, locking was worse... hdd led just lit and all freezed till
i reboot.... I had revJ board tried all sorts of patches back then, noone
worked correctly, but on end CT2 fixed it for good :) However i didnt try
patch from Rodolphe, worth a try, his solutions usual work... On other
hand, revJ seems to be odd board :)

Hi,

I try to connect to the net with iconnect 1.7 (and 1.8 too) and N.aes 2
but it's impossible. Iconnect run correctly but PPP negociation failed
when I try to connect to my ISP. I have no problem with same config in
MagiC.

Anyone can help me ?

Thanks a lot,

Cyril.

6633. Chess Champion 2175

Newsgroup: comp.sys.atari.st
Date: 2006-04-29 17:49:00 UTC
From: Ed <lener@vt.edu>
Message-ID: <e308uo$ft5$1@solaris.cc.vt.edu>
Source record: 8609

Anyone have an NTSC copy of this game? This is one of the later chess games to come out for the Atari ST and has several nice features. I have an original disk (along with box and manual) but it can no longer be read. I found the files on DBUG but that is a PAL-only version and tells me to contact my supplier for an NTSC one. Great advice, if this was still 1991. The program does not use an executable boot sector so running a 50Mhz boot disk first was no help.

6634. [UTD] May Release of Eureka

Newsgroup: comp.sys.atari.st
Date: 2006-04-30 07:45:30 UTC

Hi,

The software "Eureka" is updated on its WEB page. It is a
"2D Graph Describer and 3D Modeller". You will fetch it at :

<http://eureka.atari.org/eurka605.zip>
That is the Complete Common Edition
<http://eureka.atari.org/eurka020.zip>
Is the Complete 68020 Edition
<http://eureka.atari.org/eurkafpu.zip>
Is the Limited FPU Edition
<http://eureka.atari.org/eurklite.zip>
Is the Lite Edition, working on early ST with 720kb floppy
<http://eureka.atari.org/lib_dgem.zip>
Are Dynamic Libraries Extensions for Eureka
<http://eureka.atari.org/tiny045.zip>
Is the OpenGL Extension (requires previous package)

With this release you can better generate 3D slideshows.

I wish you big fun with this new STuff !

Best regards,

-- François LE COAT

Greetings everyone!

Here are the lucky, the few, the proud winners of this months prizes at The DarkForce! BBS:

April 2006
1. Magic Phrazes - Slor wins the $25.00 prize
2. ST Magazine - Sthelier wins the free 3 mag. subscription

Congratulations to our winners!

Also, here are next months prizes:

May 2006
1. Final Frontier II - one lucky winner, or *team* will win the $25.00 prize. Team members will divide up winnings. If the game goes into more than one month, that months prize money will be included. As sysop, I will be playing, but am exempt from winning, or joining any team.
2. ST Magazine - some lucky Atari caller will win a free 3 mag. subscription.

Good luck to all! :-)

6641. Free PEST mouse adapter!

Newsgroup: comp.sys.atari.st
Date: 2006-05-03 15:51:01 UTC
From: "Ronald J. Hall" <dark_lord@charter.net>
Message-ID: <pan.2006.05.03.15.51.01.374023@charter.net>
Source record: 8618

Folks, Alison Challis, of PEST fame has graciously offered to
donate a PEST mouse adapter for the monthly prize giveaway
at The DarkForce! BBS.

So this month, just for you Atarians - we are giving away
a PEST mouse adapter!

Remember, it only takes 1 call each month to qualify, but
the more times you call, the more chances you have to
win.

We use a small program called "winner" that randomly
picks a name from the list of callers each month...

Good luck to all! :-)

Was going thru some of my Atari Stuff and came upon
a Mega STE/TT Keyboard. The colour of letters/numbers and
etc on the keys are a Blue/Green.

And the keyboard case is white. Not a off white or
light grey.

Is this the normal colour?

phantomm@bellsouth.net

For a TT, yes. The MegaSTE is grey and the TT is bone/cream. Quite nice
I think.

Hello,

I am looking for an Atari Falcon with 4Mo RAM and an internal harddrive
(any size).

I still to this day code on the ST in my sparetime (mostly game related
stuff), and I'd really like to try myself at the Falcon.

Please email me at michaelbricout(at)hotmail.com

I am located in Eastern Canada.

Thanks,
Michael

hey mike , saluet ?? i think thats french .
i live in ontario, i code for the atari as well .
what you been workin on?
do you give advice for novice coders , and for those of us which use basic
or gfa?
i'm always busy coding midi stuff.

well i don't really know about falcons ,but its similar to a pc as far as i
can tell,
all i have is st stf ste mega st4,

charles
oh and the ever powerfull emulator "steem" which is very steady and easy to
manage.
i find atari stuff every where and will relay over to you if any falcon
related.

Source record: 8632

Salut Charles ;)

The Falcon was the last of the ST series. Some kind of an ST on steroid. It has all of the STE's features (it is mostly backward compatible with the older ST series), but it has a 16 Mhz 68030 CPU, a DSP, much better sound and GFX hardware (it has svga graphic modes, can be hooked-up to a VGA monitor, etc), an internal IDE hardrive, an external SCSI port, LAN, etc. Truly a fantastic machine.

I usually do game and demo-style code in Assembly. I have an ongoing project with a group of local retrocoders. Perhaps we'll release something, some day. Feel free to shoot any question you may have (you can email me if you like), I'll do my best to try and help.

Cheers,
Michael

Yikes! That's one expensive BBS you're running there. The cash prizes
alone are an outlay of $300 per year. I don't know what the magazine
subscriptions cost, but running the DarkForce BBS is certainly not cheap.

I've never seen a TT close up before, but I do have a Mega STE,
so this extra keyboard is for a TT then. Cool.

I like the look of it too.
For awhile there, I thought I had a rare keyboard. :)

I have heard of a Falcon with Green Letters on the keys.

Thanks,

You will really enjoy a Falcon. I started out on a 1040STe and after I got
my
first Falcon, I was really hooked. Lots of nice programs for it.
I have 6 Falcons and a few motherboards for parts. Plus alot of aftermarket
hardware/upgrades/software. Sorry none are for sale at the moment.

I do hope you find a Falcon in good working order, and maybe you can code
some stuff especially for it. We can use all the programmers we can get.

That almost sounds like the "risers" that hold up the floppy drive, except
there are 3 of the black spacers for that.

Check to see if the narrow end of each fits into the bottom of the floppy,
and the wider end fits into the motherboard itself.

Other than that, I'm afraid I don't know without actually seeing them

Any chance you could snap a pic or something?

HTHs.

Hi all,

I have a set of these binders and diskettes...

Has anyone scanned these in yet?
Did they have errors in them?
What is the status of owning them?

I have a duplex scanner so scanning them wouldnt be too bad. Is there
any call for them?

I've tried to OCR a page. There were too many spelling errors to
correct. PDF would have to be the way to go (unless somebody has nimble
fingers and a TON of free time).

Ideas?

Rory

They didn't take care of the spelling, and neither the technical details. They are only good for historical purposes, there are many other technical references that are accurate and complete. It's a similar story with the Falcon developer docs that I have.

Coda.

Hi,

I have verify but no change. Iconnect run correctly, dialing is ok, but iconnect stop (and freeze) at "ppp configurieren". I don't understand what's happened. With MagiC, no soucy. My configuration is : Falcon 030 with ct60 at 66 MHz / 512 Mb fast ram / 14 Mb st ram / NAES 2.0 with Mint 1.16.3 (from cvs) / Jinnee 2.5 / NVDI 5.03. In this configuration, STinG run correctly. I have tested drvin.prg and scc.prg in auto folder, same pb. I have tested scc.xdd and slip.xif to replace drin and scc, same problem. I have tested to desactivate all "exec" lines in mint.cnf and "run" lines in naes.cnf but same problem.

an idee ?

Thanks a lot for your helping.

Cyril.

I probably can't help you but I know for sure that back in the time
when I was using a dial-in connection I was able to use Iconnect under
N_AES 2.0/FreeMiNT 1.15.x.

If it works with current cvs freeMiNT kernel I really don't know as I
don't use a dial-in connection anymore.

Anyway I think the starting order of auto prg's is important. Can you
post your auto prg's (in starting order)?

Question: Why do you want to use an inferior PPP-stack instead of
MiNTnet?

Hi,

I've open the TT case and disconnected the power lead which
goes to the HD. This is the right hand side lift up cover.

Ran the latest demo version of HDdriver and I get the same as before

BUS0 ACSI
BUS1 SCSI

The bee has been busy for approx 10 minutes. The option to 'Esc'
makes no difference.

So it's not the HD that's corrupt then...?

Hi all,

Sat lurking in a cupboard I have a Gasteiner mega drive ASCI model.

What are peoples thoughts on setting the TT up to boot from this to
prove if its the SCSI controller thats broken.

There TT appears to function perfectly when booten from FD.

Are there any software tools to help diagnose which part for the
hardware is faulty.

Cheers
Dave

Ok this is getting stranger. With the ASCI Gasteiner mega drive
plugged in and running HD Driver 8.1 (demo) I get the following...

HDDRUTIL 8.16 Device Check

Operating System: TOS 3.05

Bus 0: Atari ACSI
00.00: SEAGATE ST1096N
Direct Access
Bus 1: Atari SCSI
07.00: ATARI TT HDDRIVER 0816 Processor

Does this mean that the SCSI drive can now be seen?

Itï¿½s a new year which means a new CCAG Show!

Buy, sell, trade, play, and see classic video games, computers, peripherals, memorabilia, and more at the Classic Computing and Gaming Show (CCAG) on May 27, 2006 (and again in October, 2006) at the National Guard Armory, 3520 Grove Ave. Lorain, Ohio from 5:00 PM - 9:00 PM. Vendors, clubs, and collectors will be displaying and selling their retrogaming and retrocomputing goods, from Pong and Atari to Nintendo, Apple and IBM to Commodore and everything in between with many set up for you to play with and explore. We have 5000+ square feet of space. Help us fill it all up!

For more information please go to http://www.ccagshow.com/

And this week, I was able to setup a null-modem connection using PPP
between my Linux box and my Falcon, to debug network code. For people
interested, I made a page about setting up the null-modem PPP connection
on my site.

On the networked game side, network game packets checksum routine was not
endianness friendly, so I had to disable it. I was able to play a game
between my two machines. Note that it was working before, but only between
systems with same endianness.

Noooo its not like a PC in any way .. (if you have to compare, compare
to other motorola based machines like the Macintosh or Amiga, but not
that intel based monster.)

its 'just' an ST with a 030 processor and more ram, better video.. etc..

It was the 'next generation' of the ST series (and it ended up being
the end of the line too)

Never got one when they were new.. now its hard to find them, espically
at a reasonable cost.

Lot - A separate portion; a number of things taken collectively; all
objects sold in a single purchase transaction; as, a lot of stationery;

The title says "Lot" and according to the contents it does indeed seem to
fit the description.

It means that the Seagate drive can be seen and that the TT's SCSI ID
can also be seen. Looks quite normal to me.

Hi,
No there's been no other devices attached to this TT since I got it
almost 1 year ago.

Would it be worth trying a different HD and ensuring that it's
terminated.

Hi Martin,

indeed. Yes, I'm still reading this one (not anything else on Atari),
just to keep an eye onto stuff like these Matrix cards. At times
there's some valuable info....

The Ataris themselves are fully covered with dust, tho' .... and the
strange part is that I'm not keen on selling em either.

Take care,

Louis

6701. Is Welfare Part of Capitalism?

Newsgroup: comp.sys.atari.st
Date: 2006-05-09 08:54:15 UTC
From: defendingtruthwithscience@yahoo.com
Message-ID: <1147164855.621539.196600@j73g2000cwa.googlegroups.com>
Source record: 8577

This article is dedicated to:

A man I met, with most of his body heavily burned, simply because he
was a Chinese during the 1998 May Riot in Indonesia.
Lots of capitalists that are slaughtered during the cultural evolution.
Ten thousands of peaceful smugglers that are massacred in Banda island
by the Dutch for conducting peaceful spice trade and all that are
similar to them.
All minority groups and individuals that face discrimination, even
genocide, for economically contributing too much for their society.
All customers that have to pay higher products due to protection of
tariff and trades.
Productive people that are fined with income tax for the victimless
crime of making honest money.
Smart students that are slowed down so not to move too fast.
Industries that do not get subsidy, or even banned to protect
unproductive industry and laborers that earn much less due to such
restrictions.
Poor starving people that could have been rich had their countries
choose to embrace free market.
Women and males that are trapped in unhappy marriage which they have a
hard time getting out.
Women and children that have lots of their best choices taken under the
pretext of protection.
Immigrants and refuges.
Is welfare part of capitalism?

In short, no. In consensually, punishing the productive through income
tax to reward parasitic behavior is the biggest affront against the
principle of free market. In fact, from many governments intervention
in economy, the one that proponents of free market often oppose the
most is welfare.

However, when we look further, capitalism and welfare is not really
total opposites. Most importantly, properly done, a straight forward
welfare program can cause less market distortion, and hence an
efficient replacement to buy votes from losers, than farm subsidies,
public schools, minimum wage, trades restrictions, tariffs, and sex
laws. If it's done by taxing wealth, rather than income, the amount of
market distortion can be minimized further.

Welfare is also cheap. It'll cost $5000/year to a welfare recipient
in USA, for example. However, we need to remember that the
recipients' lifestyle worth only $500. The other $4500 goes to
implicit welfare due to higher living costs. That implicit welfare

includes minimum wage, immigrations laws, and food subsidy, or protections.

If somehow a straight forward explicit welfare program can replace all relatively more evil governments' interventions, then capitalists are probably better of not opposing welfare so much. Even Milton Friedman supports schemes called guaranteed minimum income, which is like welfare but with much less market distortion.

That's not where the similarity ends. One of the main creeds of capitalism is that consent and competition should be preferred over force. Without that consent, anyone can simply make us choose to make our self worst of under the pretext that it is for our own good. In fact, most laws against consensual acts can be traced down to protection of some disgruntled competitors often done under the pretext of the consenting parties' own good.

Anti prostitution and anti polygamy laws, for example, is there to ration females to poor dumb males under the pretext of protecting the consenting women. Of course, all natural resources tend to be rationed somewhat proportional to ones' voting power. And that does explain why democracy and anti polygamy laws go hand in hand too. One man one vote soon leads to one man one wife.

Well, at least Matt Ridley agrees with me and he's a well known mainstream scientific researchers. I guess that's also why so many uncompetitive people want to ensure that evolution theory is not taught in school. You can also read a famous psikiatrist book, "The road less traveled," you'll see that life long monogamous marriage is just a trap to prevent highly desirable people from being available to those who they want more, and romance is just the lure to that trap.

On the women side, anti pornography laws is really meant to prevent highly desirable women from advertising her assets and hence protecting less pretty women from the higher industry standard a public display of superior desirability might cause. Countries that embrace porn tend to have prettier women. Where did all the unsexy ones go? They're all shifting out of the gene pool, and hence are doing their best to oppose porn preaching religious doctrines that men should judge women based on any features but beauty, which they can't offer.

Another issue is consent. Welfare program is not consensual; however, it's relatively more consensual then civil war. In ancient time, when we have different ideological opinions, we end up killing each other to proof who are "right." The Catholic would kill the Gnostic, the Sunni would kill the Shiah. One King would kill the other. A younger prince will argue that the older prince is demon. Might makes right.

Such differences of opinions are of course solved with war, which is a very cost inefficient way to know who're "right." However it does work in some subjective practical sense. If we look in the past and try to figure out whether the Gnostic or the Catholic is the one that's

heretical or "right" respectively, we need only to see who won. The Gnostics are slaughtered, so they must be the heretic, or do they? At least I bet there are way more people in the world that think that way than the other way around, excluding me actually.

It doesn't matter how many books many institutionalized religions burned, how much restrictions of freedom of speech and irrationality they embraced, how many witnesses they snuffed outs and all other techniques that would not have stand the scrutiny of a peer reviewed scientific journal, or even a reasonable jury in the court of law. Too many people don't believe who are right and reasonable, they believe who are mighty. Right or wrong, the win will always become right anyway.

Now, under democratic context, we don't kill those who oppose us, rather we try to persuade enough people to join our cause. How do we persuade them? By money of course. Welfare program is then a reasonably cost efficient method to buy votes.

When too many people are on a side, we will sort of know that going to war will hurt the other side; hence we comply anyway with the whim of majority avoiding the costly alternatives. While not ideal, this is indeed how right and wrong is really decided, proper assessments of each sides' bargaining position and mutually cherished compromised line of war, plus a bunch of lies covering what's going on to safe each sides' face.

No matter how noble the purpose, lies and prejudices lead to misunderstanding, that leads to more war. Hence, the best contribution is simply to unmask all lies.

All in all, peaceful democracy is indeed a more cost efficient ways to measure ones' bargaining position. While democracy often lead to decisions opposites of freedom, like popularly supported victimless crime, income tax, and welfare, it's indeed relatively more cost efficient than civil war.

That's not when the coherency end. Various natural laws restrict various possible political outcomes. We can't expect a stone will fly to the sky when we drop it as much as we cannot expect a human to be generally unselfish. If we want to kill our enemies, we'll do well dropping a big stone on top of our enemies head rather than dropping the stone on top of our own head expecting the stone to somewhat magically fly to the enemies head.

The same way, we can't demand market distortion and expect that the best and brightest among us to still magically be a nice tax payer rather than dictators and corruptors. In a country where selling porn or building a good franchise chain is more difficult and less lucrative than becoming a dictator, guess what the smart would end up doing? Ask Saddam.

If we want rich and prosperous countries, we must know that it will and only will happen when we properly align individuals' interests with productivity.

Such coherency tends to make certain things come in package with another. We can expect that moving electric field will induce magnetic field. The same way, in life, we observe similar things. Communism and socialism, for example, always come in package with dictatorship and corruptions when smart people realize that being dictators pay more than building a business empire.

To the opposite capitalistic countries comes in package with softer deals for losers, such as, guess what, welfare.

We know from our economic classes that free market capitalism brings prosperity within market mechanism. However, it turns out that the prosperity that free market brings also profit the less successful beyond market mechanism. Capitalism and the prosperity that come with it tend to facilitate ideological changes in ways that benefit the less successful. One such ideological change is the popular support for losers' benefits. One such benefit is, guess what, welfare.

The most obvious samples of such ideological shifts the free market bring are the elimination of slavery in US. What happened? As usual, the northern part of America is an industrial country. At that time, steel industries are relatively more modern than the farming industry. Higher tech industry increase labors' productivity. When labor's productivity goes up, entrepreneurs will want to hire as many workers as possible. Hence, labors' salary will go up. This will kill of industries with less labor's productivity. At the end, the marginal productivity of labors in the least productive industry will go up. That value is labors' salary.

Under competitive equilibrium, the more productive and efficient a person is, the more he benefits everyone in the chain of productivity except those similar to him. Hence, an entrepreneurs coming up with ways to improve labors' productivity would benefit everyone, including workers and consumers, at the expense of other entrepreneurs and capitalists. Read that Karl Marx!

Then what? When labors' salary goes up, obviously labors will move to the employers that pay them higher. Hence, farm labors in the south want to move to the north. They can't do so legally though because they were slaves. Hence, the northern capitalists in US want to free slaves so they can hire more workers. And then the southern capitalists in US want to keep slavery. This then results in war. The bigger the labors' productivity, the more intensive capitalists have to free slaves. The more supporters there will be on a cause the more likely the cause won. Hence, slaves were freed.

Unfortunately, people still want to help losers and buy votes from those who are too expensive and too stubborn to switch. That explains why the farms in US gets subsidy.

If losing means not as successful as the other, then there will always be losers. However, we see how free market shifts the worlds' system in ways that benefits the losers too. Unlike the commies' propaganda, capitalism does not cause or even enlarge disparity of wealth. Capitalism only changes the way such disparity are earned to the benefits of all.

At the end of the warring states period in China, the king of Chin, Shih Huang Ti, and his prime minister, Li Si were the winner. Within one generation they have all their family slaughtered. If that's what winning means, what did losing means in pre-capitalistic countries? In ancient time, losing meant having all the males slaughtered, enslaved, or castrated and all the females raped and winning means risking your whole family slaughtered by rebels. In socialists countries the rich are corruptors and dictators that slice each other throats while the poor are starving.

Now, thanks to the prosperity only free market can bring, losing means they can leave on welfare, with plenty of chance to climb back and proof their worth, like J. K. Rowling. Now, slaves are so free and highly paid thanks to increase in labors' productivity. In fact, when slave jobs are moving to China under globalization, slaves in US refused to be emancipated and want to keep their slave jobs in US rather than evolving into entrepreneurs. So, much for the land of the free and the place of the brave. Some people don't mind dying for what they believe in but are too scared to start a business. Evolutions will fix that I guess.

Free market gives abundances to everyone. The benefits the free market brings benefit those less capable from being successful not only within the system but also through non market mechanism, like the ending of slavery and the start of reverse slavery we call welfare. But how do those really work? Is there a general principle?

Each of us is greedy and selfish that we want as many as possible for us. Humans' greed and selfishness is an undisputable scientific facts, as sure as the sun rise in the east, as sure as a stone will fall to the ground pulled by gravity. We're not just greedy and selfish. Greed and selfishness doesn't explain all the war, suffering, and poverty we face.

In fact, greed is good. Properly aligned, under free market, the greatest among us shall be the one productively providing the best service to the most customers. Blessed be the productive because they'll be rich. This will encourage higher and higher standard of living that we are currently enjoying.

Free market allows those who serve more to grow richer. To those who have more profit, to those more capital are given. Even kingdom of heaven don't mind using this nice positive feedback effect. Who needs new deals to break up companies?

Also, women prefer the rich. The next time you watch soap opera, make sure it's made in some country with the highest IQ in the world, like Hong Kong.

Free sex means richer males will consensually attract and mate with more women producing more kids. That's the whole point of getting rich by the way. Duh?

In fact, that's what being a living human male is all about:

1. Gain control ship of as much money or power as possible.

2. Attract or in anyway acquire as many females as possible.

3. Make kids.

4. Use that kids as tools to make grand children.

You bet it's right because it's science. Of course, they don't teach this important fact in biology class because government interfere in education.

Hence, when we're free, without genocide, without war, even with humanitarians aids given to appease enemies, the meek will indeed inherit the earth.

More than greedy and selfish, some humans are simply not humans because they embrace the root of all evil, envy. That explains why we have so many laws against mutually beneficial consensual acts and governments regulations to protect us from our own choices. The truth is, all those laws and restrictions are more often not there to protect stupid people from making mistakes. All such laws are there to prevent the smart from making the right choices.

That's why, for example, every body has to move equally slowly in school, to prevent the smart from moving faster. That's why various reproductive techniques are politically incorrect proportional to the expected quality of genetic material that will be duplicated. In particular, life long monogamous marriage, free sex, prostitution, polygamy, and cloning are sequences that both have increasingly expected value of genetic quality outcome and politically incorrectness.

In Europe and China, the smart monks are encouraged not to get married. When some minority groups don't buy the bullshit and hence greatly improving their productively earned wealth and genetic quality, such minority groups somehow become victims of genocide.

Life is like a real time strategy games. That means when we're not at war, we're in a race. That's simply how we evolve. Morality, religions, and ideologies, are stuffs created by really smart people to persuade us to run backward.

Peace means we're in a race. Freedom means we are in a competition. Some people just don't want to compete. Hence, they craft lies and

prejudices against those who are in front preventing progress to prosperity.

I'll tell you the scientific truth. It's from the fruit we knows the tree. Anyone opposing free trades and globalization is more evil than Hitler or Nazi. If only Japan and German could have acquired natural resources through consensual peaceful trade, Nazism wouldn't have been popular there and Hitler wouldn't have risen to power. With his mass hypnotic skills, he may have ended up as seminar speaker I guess.

If only those who had wanted to incite the Second World War see all the miracles and prosperity the free market brings, they would have repented and embrace free market. Yet, after all the prosperity and wealth the free market is bringing to all of us, still many people choose to oppose competition, and hence, miss-properly align our interests from productivity. That is the cause of all evil in the world.

All causes opposing free market can be negotiated and appeased. However, if the very thing that a group of people want to prevent is the success of the others, then the situation is pretty much kill or be killed zero sum game.

How does such situation usually end up? What would be our optimum solutions for such situation?

Under normal circumstances, an optimum solution of any business decisions is a solution where the marginal revenue equals to the marginal costs. Hence, in a zero sum game, each party will try to maximize its benefit to that point. Sometimes, the marginal costs have a spike. There is a certain point where increasing a resources allocation beyond a certain point will create adverse costs. For example, increasing the number of labors will increase revenue.

After a certain point, increasing one additional labor will mean buying a new machine or building a new factory. We may end up choosing to do it, we may not. In either case, discretions are the better part of the valor when it comes to that line.

The same way, in most countries, each of us can increase our profits using property we own or consensually rent. When we maximize our profit that way, the public will, ideally and some times truly, not interfere, and defend us from being prevented to enjoy our "rights" by others. However, when we start using others' property to maximize our gain, say by stealing, public opinions may shift from protecting us to against us.

Hence, the choice whether we should steal or not depends on the extra costs of crossing the politically correctness line of war. If a person sees that the potential gain justifies the increase costs of public support shifts, he'll still steal and make a great career out of it. Otherwise he'll stop stealing while coming up with a pretext to

justify his cowardly decisions, such as morality.

But what do the people choose their reaction to a specific act like stealing? They do so based on their sense of fairness, justice, and right-wrong discernment. How do people get that sense? From ideology. The ideology, religions, or whatever, then decides the line of war where the rest of us should consider before crossing. But how does the line gets drawn? By estimates of bargaining position.

Let's examine an example. Is the King (or Queen?) of England the King of France? Don't know. How do we know? In the beginning, a ruling class from France went to England and become king of England. Then they lost control of France. Hence, king of England wanted to take back the controls they have lost. Well, such conflicts are solved by war. In this particular case, the war lasted 100 years.

The British attacked France and successfully route knights with long bows. Then, the Frances stroke back driving the British back to their isolated islands. However, the France cannot move further and go all the way to attack British because of the Strait of Dover separating the two nations. Finally both sides realized that the straits somehow became the sacred line of war. It's not auspicious to cross the line of war for either side. The France, having more army and larger population would beat up the British on land, and the British being stronger at sea can always repulsed France sea invasion. Hence, we got peace.

Such natural separators like straits and mountains explain why Europeans are divided into many different countries. The Chinese, not having that natural line of war, end up getting united all the time.

Now, let's get back to the question whether welfare is part of capitalism. If all of us have just enough food, and some people don't work, what would we end up doing to those who are not productive?

Humans' basic instincts and preferences lead to gene pool survival. When food is scarce, such as when the people demand centralized planning, it would serve ones' gene pool survival to slaughter the parasites rather than sharing food to them. That's because sharing food to those who do not earn it means starving ones own self. In fact, humans will kill each other to literally eat each other when food is scarce. Such is what happened in China and Rusia when centralized planning, governments' intervention in economy, and prejudices against successful capitalists became the norm.

However, when food and money are abundance, such as when the people embrace free market, fighting the parasites might cause more gene pool survival lost than feeding them. On the other hand, simply giving and yielding toward threaten will motivate people to keep pushing us around. Moreover, giving in to those who can use force against us will motivate countries to build arms rather than say, better video games.

Hence, one possible strategy to minimize open war while still properly aligning ones interest with other individuals around them is to give to those who ask nicely and ask less. As free market brings a lot of abundance, those who are needy can be appeased much more cheaply than those who are envy, and hence, we got welfare program.

To be frank, I'd rather see the unproductive people have bigger TV rather than letting them make more kids. It's more humane, and cheaper. Guess what? Most people that know they're not very capable either would rather have that too.

Back to the France vs British. If only both sides have realized the true bargaining positions of each, they wouldn't have to resort to such expensive 100 years war right? The thing is, the 100 years war are the most credible and accurate ways to measure ones' bargaining position. War shows which one is stronger, and hence leads to a mutual understanding of where the line of war might be.

If only we can wave our gun and scare the enemies, it'll be great. However, the only threats that are credible are those actually done.

How do we know a cause's bargaining position? Democracy might give some light by counting the number of those who are in favor or against what we consider lesser evil. However, number counting can be deceiving. We hold this truth with plenty of evidences, that humans are inherently different.

We have difference capability and preferences, and hence different choices and outcome. It's useless to lay net in front of anything with wings. Those who are genetically predestined to be successful will get rich anyway whether through honest capitalistic means or through dictatorship.

Those who are small in numbers can hence be quite strong. Preventing the smart from making money honestly will then turn them into corruptors and dictators. When the Chileans demand to prosecute their entrepreneurs, they end up getting a dictator, the way any country that demand slavery over freedom deserves. Fortunately, Pinochet are relatively benign compared to others dictator and embrace free market giving the miraculous prosperity that the Chilean now enjoy.

Now, US government arrested his daughter for a crime of tax evasion. An act that wouldn't have been a crime if making honest money is free. The miracle of Chili becomes the model of China's moving to free market. It also helps to end communism all over the world peacefully. If capitalists fail to show thanks to Pinochet family, I don't know what would happen to all of us.

So, beyond number counting, the more accurate ways are then through skirmishes. When people cross the public's opinion line of war and we don't strike back, the line of war will shift against the coward by precedence. By fighting back, we'll then have a more accurate knowledge of which one the public would agree with.

Hence, it's very important to retaliate to what others do to us, either good or bad. It's a pleasure to serve my friends, it's also a pleasure to wipe out envy enemies that are on our ways, should my friends wish or don't mind.

When a fraudster tricks my brother over $3,900, my main concern is not to get my money back. My main concern is to get the fraudster to jail even if that will costs far more money than the $3,900. When a thief steals my money on 2001, my concern is also not to get my property back. What's just is to encourage the whole world to post any thieves conviction records on the net to prevent further larcenies.

It makes me wonder though. Why people consider it cruel to damage a thief or a fraudster' reputation? The mere acts of making honest money are punishable by income tax. When Everett O. Lasher makes an argument in court, the case leads to $5000 fine, and understandably, a suicide. The mere acts of successfully fending of ones' home from thieves lead to a life long jail term for Tony Martin. Thousands would march against WTO demanding harsh laws to punish those exercising consensual trades. In Iran, the mere acts of switching religions can lead to death penalty.

In Indonesia, new laws are being drafted giving years in prison for kissing in public. Of course, public rape during May riot are still far from being punished.

This while murderers of Vincent Chin went free without jail term. Thousands would march to end death penalty against murderers. In Indonesia, religious fundamentalists can come to a house and destroy properties from houses providing consensual entertainment with polices watching. Those people often get away or lightly punish.

If consensual productive acts are punished while damaging inconsensual forces are not, soon, all highly productive people would end up in gas chamber after the next Cultural Revolution, or what ever. Those who are left are those smart enough to be dictators enslaving the rest of us.

Prejudices reminds me of an envy old hag that's so determined to ruin my reputation for being friendly to her and her friends, after her own friendly communication. I never intended to fraud anyone or steal her money yet I got my reputation ruined. I am very disappointed to see that there are people in the world that want to bring me down more than they want to bring down a thief.

I have tried to resolve the issue privately by suggesting to that thing that she's really not important enough for anyone to pretend to be her friend. Moreover, I didn't need her as a friend. All this was just a damage-less misunderstanding caused by her own friendly communication which I could simply publicly straighten out. At least, it used to be.

However, that vermin really wished to get the issue public telling lies that she never communicated with me, possibly to boost that things' feeling of importance her genes deny her. Well, if she got so mad over a few friendly introductions, I can only wonder what that thing would

do when it finds out that her true envy natures are revealed to 55000 newsgroups several times. It'll happen again and again whenever I feel like.

Hence, just look for "envy vermin" on the net to find out what's really going on including what she said privatedly. Let the public decide who are more honest, rational, scientific, and straightforward. Let the market decides which one are worthy and who are worthless. It's a great mistake to ever consider such thing as a friend, a mistake no body should do. It's her kind that turns people of from making money productively.

Hopefully we can undermine public opinions against all form of envy motivated lies and prejudices. At the end, we'll greatly weaken laws against victimless crime and easily out compete all envy people out of the gene pool. That'll ensure that the free fair market competition would reign over war when all lies and prejudices against those more successful are gone.

Now that being said, I want to move all jobs that can be done online to Asia, especially, copy writers. Take advantage of the value difference and leverage like hell is how we all make money in any system. Who's with me?

Free market is all merciful and all compassionate. At the end, even those that oppose free market will benefits from free trades.

6702. Superboot or something else ??

Newsgroup: comp.sys.atari.st

I have a Matrix M128 card with the original Atari drivers. Does anyone know if this will work in a Mega STe? Also I noticed the card has a 15 pin connector (SVGA style) although I'm pretty sure this is a mono card. Does anyone know what the pin out is for this connector? Is the output ECL by any chance?

Cheers

Ian.

Personaly I prefer Xboot. I'm using it since the early days. Xboot
never have let me down. I'm still using it on the Hades.

Yes, that's definitely worth trying. Ensure that not only the HD but
also the TT is terminated because both physical ends of the SCSI chain
must be terminated. If only one HD is connected to the TT, the TT must
be terminated because it is located at one end of the chain.
The terminators are located on the TT's motherboard, close to the SCSI port.

If you are missing the resistors from the MBO you can always pop a
terminator on the external SCSI port.

The TT has only one HD at the moment so wouldnt the terminators on the
board be already terminated? I will obviously check though.

Ok... leads me on to the next question... what are my options on HDs?
I have a brand new IBM 36gb sat doing nothing, it has the ultra scsi
68 pin connection but could I use it with a pin changer?

Yex, you can use any SCSI-2/SCSI-3 drive, as long as you have a pin
changer. Since these pin changers are not Atari-specific it is usually
no problem to buy one.

Hi,

I recenty picked up an Atari STe which was fitted with a Veloce+
accelerator. This seems to work fine - but I wondered if anyone had
any drivers or docs for this device? I've found a few review articles
on
the web, but no drivers or other info.

Thanks

Ian.

The terminators on the MBO are removed when you have a device on the
external bus. This device should be terminated, or there should be a
seperate terminator after it. If you have:-

1) No terminators on the motherboard
(becuase the machine once had external devices and no longer does)
2) No terminating resistor pack in the spares drawer
3) No external devices connected

Then putting a 25-pin terminator on the external SCSI port should correctly
terminate the bus. The practice is common on SUN Sparc Stations...

Speaking of 1st Word....

I have 1st Word Plus from GST Software.
Version is 3.20TT
for the STF/STFM/STE/Mega ST/TT as Labeled on the disk.
It is in new condition, have never used it.

Was wondering if anyone still uses it and would it make a good editor to
use with programs like Newsie/Oasis to write/edit E-Mail and etc?

phantomm@bellsouth.net

There are alot of these. I have used SuperBoot on all types of Ataris
including
the Falcon with a CT2B, and it works well.

However, there are a few more for the Falcon, that have special features.

I believe one was called Start em Up, but not sure if It was for all
Ataris or not, but I believe it was.

Closer to Papyrus IIRC. It uses SpeedoGDOS. But it is a document processor.

It does run on the Falcon. But you need NVDI or SpeedoGDOS.
>

Hey. Have you tried running the program? For some reason, deep within the
(admittedly foggy) recesses of my mind, I'm thinking thats a dongle for
copy protection. That if its not plugged in, the software won't run.

I remember screenshots of DynaCadd when it first came out. Looked amazing.

A further followup - a google search revealed this:

http://www.atarimax.com/freenet/freenet_material/
6.16and32-BitComputersSupportArea/8.OnlineMagazines/showarticle.php?167

(that should be all one line)

-Its an interview on Znet with the DynaCadd people-

"Dave/Nate-ISD> The upgrade cost from DynaCADD 1.84 to 2.0 is US $99.95
or the equivalent in Canadian dollars, about $119.95 this week. And
yes, we have finally changed our cartridge port dongle and replaced it
with a small, tiny, little, unobtrusive joystick key. We now have all
the neccessay ingredients in-house for proper Digitizer support,
including DynaCADD specific templates as well as the accessories to
drive the CRP Digitizer."

So it looks like it plugs into the joystick port. I'm assuming #2 since
you're using the mouse in the program. :)

Hope this helps Barry.

> Is there a program for the Atari that will play WMV files?

Didier Mequignon ported the Unix mplayer program a while ago, so maybe it could play some WMV files. However most codecs required are win32/x86 only, and on Linux/x86 for example, mplayer uses wine as a library to load win32 codecs.

6733. Re: Iconnect and N.AES 2.0

Newsgroup: comp.sys.atari.st
Date: 2006-05-12 09:30:01 UTC
From: cyril <bibou7@free.fr>
Message-ID: <1147426201.404728.309400@v46g2000cwv.googlegroups.com>
Source record: 8460

Hi,

my auto folder order is :

_ DFB_AUTO.prg (boot selector)
_ CT60XBIOS.PRG
_ DSPXBIOS.PRG
_ CKBD.PRG
_ CLOCKY.PRG
_ NVDI.PRG
_ EXTENDOS.PRG
_ CENTSCREEN.PRG
_ SOCKETS.PRG
_ MINT040.PRG

I have SLIP.XIF and SCC.XDD in C:\MINT

I have tested to replace scc.xdd and slip.xif by hsmodem drires but no
results.

ACC :

_ Cops.1.08 (I have tested 1.09 version but he can't load all active
cpx. He read 16 cpx max. If I try to reload, I have 8 cpx. I have
tested with copsload too, but same problem)
_ N.Fileselector
_ CT60 Temperature
_ Mint Setter
_ St Guide
_ M player 2.9b

CPX :

_ SESSION.CPX (Extendos)
_ BUBBLE.CPX
_ CLOCK.CPX
_ COMPOSE.CPX
_ MOUSE030.CPX
_ CT60CONF.CPX
_ FILEINFO.CPX
_ NCACHE.CPX
_ NPRNCONF.CPX
_ NVDICONF.CPX
_ NCONTROL.CPX
_ WCOLOR.CPX
_ DFREE_VF.CPX
_ GENERAL6.CPX

_ HDDRCONF.CPX
_ IMPRESS.CPX

If anyone help me,

Thnaks a lot,

Cyril.

Hi all,

While MagiC and N.AES allows programmers to specify which char (by setting WHITBAK flag, plus position of the underscore in bits 8-14 in OBJ_STATE) in a button text that should host an underscore, does anyone know if the AES is also responsible for handling the actual keyboard short cut?

*That is, should FORM_KEYBD() detect that a particular key combo, for example ALT+D, is defined and report back to the app that the corresponding button was pressed? (From what I can tell, MagiC will for example report that the key even was not used/eaten by FORM_KEYBD whereas XaAES will, and then report back that an EXIT button was pressed)

*Or is the AES in this case just displaying an underscore on a button text character, and nothing else...? (Which would seem like a rather crippled implementation, so I hope this is not the case)

Regards,

/Joakim

I have DB3 and it works with floppies, hard disks and SCSI tape drives. I am not sure about ZIP drives. It may if the computer views the disks as a hard disk. Jaz drive backup may be possible, but I never tried it out.

Seems good to me. The only different with my setup is that I used the
HSMODA drivers (drvin.prg, scc.prg) and MiNT kernel 1.15.X

I never has used ppp-connect with newer kernels.
Maybe you can try it out with the 1.15.12 package (if these works on
CT60's?).

AFAIK, there is a problem with Cops 1.09. I use 1.08 myself.

I wished I could help you more but it just too far back in time (2001)
to remember me the details.

M_player suports all kind of formats (mov, avi, mpg, flm, fli, flc,
flh, gif, dl, bat, cdh, cdl, cdv, seq, dlt) but no wmv.

wine a library?

1st Word as an e-mail editor? What's wrong with Everest or Qed?

It's *bad enough* people sends e-mails in html format, don't make it
worser by sending e-mails nobody, except those with 1st Word, can
read.

Anyway 1 st Word is history. It hardly runs on modern systems.

Well, I did say that I had never used it.
So if it does not allow the universal Text format, then
it's news to me.

Nothing wrong with Everest or Qed, I have used both.
Just came across a new 1st Word Plus package and it looked
decent. Thought I would get some input from some that have used it.

Sure does, thanks for the info.

The Dongle had me stumped as it looks to wide to fit in the
9 pin joystick port.
When I do set it up, I'm going to use one of the MouseMasters
that I have for the dongle.

Thanks Again.

It can save in ascii but 1 st word own format can only be read by a
few programs. Calamus for instance can import 1 st word docs.

My point is that if one use 1st word as a e-mail editor one will try
to use it's possibilities but now I'm think about it I believe it
would be impossible to use it as e-mail editor.
>
> Nothing wrong with Everest or Qed, I have used both.

When it came on the market it was a very good program indeed but as
said before it's a old program which doesn't run very well on

N_AES/XaAES.

Back in time I've used it but I never managed to print the docs out
properly.

BTW, Martin I have often wondered why you still have links to
programs on UTSI that no longer exist, such as for
Apex Alpha, and other Titan related software as well as others?

6751. Graphics on Atari

Newsgroup: comp.sys.atari.st
Date: 2006-05-12 23:55:42 UTC
From: phantomm <phantomm@bellsouth.net>
Message-ID: <Sf99g.42311$Kn4.36650@bignews2.bellsouth.net>
Source record: 8478

I know alot of Atari ST-Falcon users have moved to other
platforms for Graphics work.

Was wondering if anyone reading this group still uses any of
the Atari Graphics/Animation packages that were released?

I personally have tried to collect most all of them, and there was
some really nice software created. Especially if you had a good
Graphics card and or a Falcon.

Music related software was big on the Ataris for awhile.
I'm sure there are still people like me who still uses their
Ataris for Music related stuff.

But I really never heard alot about the Graphics/Animation
area. Anyone still using their Ataris for Graphics stuff??

If so, what Software are you using and for what uses?

phantomm@bellsouth.net

Hallo Martin!

MB>Anyway 1 st Word is history. It hardly runs on modern systems.

It surely runs on my Milan. In 1280x1024x64k.

Version 3.20 TT was quite cleanly written for its time.

No, the Mplayer from the unix world.

http://perso.wanadoo.fr/didierm/files/MPlayer-1.0pre4-atari.lzh
Works fine with the DVD support in Extendos.

Sure it's slow, it's just a compilation.
I have never tried crosoft files.

Hi Martin,

I don't know if 1.15.12 run on CT60... But the Mint kernel of NAES 2.0
don't work (I don't know the version number of it)

I'll try 1.15.12.

Thanks a lot,

Cyril.

Digital camera on a tripod. Failing that, one of these TV RGB in cards for a PC. The output from an emulator though always seems excellent and final when compared to those methods.

Hi Dave,

Depending on which Atari you wish to take the screenshot on, there are
different solutions. If you have MiNT installed, I would say that
"GFASNAP" might be useful, saving images to *.TGA. I also recall a desk
accessory called "SNIP" which saves *.IMG files, but I can't recall if
it was just for monochrome mode or colour too.

You might perhaps also find some useful information in this thread:

http://www.atari-forum.com/viewtopic.php?t=7545&highlight=screenshot

Euch, good question.
Lack of free time is one of the reasons.
Before I delete links I really want to be sure the software in
question doesn't have a link anymore. This involve lots of internet
searching, etc... Read time consuming.
In case of Apex Alpha and other Titan realated soft I think I can
delete the links.

Maybe I will work on the UTSI this weekend.
If you (or others) have new links please let me know.

TIA,

Martin

There are a few utilities you can use to maka a snapshot of the
screen.

JML_Snapshot. Make a snap in (X)IMG, IFF and TIFF
German/English version
<URL:http://www.the-mclouds.de/> Follow the link software. You can get
a free key (Freier Schlï¿½ssel) to unlock the shareware restriction.

GFA Snap. Requires MiNT
<URL:http://www.bright.net/~gfabasic> Follow the link downloads

Snapper
<URL:http://www.jebnet.de/atarisoft.html>
<URL:ftp://chapelie.rma.ac.be/atari/graph-tools/snapper.zip>

TTFN

I'd try these three and then decide:

Thing
Teradesk
Jinnee

Jinnee is commercial though - you'll have to buy it, although I think
there is a demo somewhere. Thing and Teredesk are free, try them out first.

Hmm, I've got NAES v2.0 and easymint installed here, on my CT60
Falcon, which I believe uses 1.15.xx, AFAIK.

Thing is *not* free. It's shareware.
Personaly I use Thing 1.27 which I prefer above Jinnee. I do have
Jinnee (registrated user) but I don't like it very much.
Thing, Teradesk and Jinnee, all works fine with MiNT.

HTH,
Martin

Ok, I've a little bit exaggerated. 1st word does run on my Hades too but
it has some redraw probs (on N_AES and XaAES) and it eats all available
memory if you don't take precautions. I only let 1 st word uses ST-RAM.

All by all it doesn't runs very smoothly.

Message-ID: <1147551399.556529.42470@d71g2000cwd.googlegroups.com>
Source record: 8495

Hi,

I've just moved house and have a new cable broadband service
(WightCable - UK) which uses dynamic IP addresses. I have the following
equipment which I'd like to use simply to share the cable link for
Atari and PC, I dont need a full LAN with file/print sharing or
anything else.

Motorola SurfBoard SB5101E Cable Modem
LinkSys EtherFast BEFSR41 4 port router with NAT anad DHCP server
facilities
Dell Laptop PC running WinXP
Atari TT030 with EtherNEC running MagiC v6.2 and STiNG v1.26

I have had no luck in configuring the router at all to get it work with
the TT. The Laptop can access the network no problem but I believe it
is simply using dynamic rather than working the the static NAT
addresses which I've tired to assign. The manual for hte router is next
to no help, and I'm not that used to dealing the broadband links, so if
anyone has any guides on how to get it all running, it'd be really
appreciated, as up until now I've skirted around it by using consumer
broadband for PC and dial up for Atari.

You must give the TT a static IP address. Normally you can set that in
the router setup. On a Linksys you can probably set this in the "access
restriction" menu --> edit list of pc's

Then set that static address in your Sting network configuration file.
It must look like this.
lo0 127.0.0.1 127.0.0.0 255.0.0.0 127.255.255.255
ne0 192.168.1.4 192.168.1.0 255.255.255.0 192.168.1.255

The default route should point to the IP address of the router
ne0 192.168.1.1

Be aware the above examples are taken from my mintnet setup. How the
syntax is for Sting I really don't know.

Would you happen to have the Apex Alpha Demo?
I know Titan was working on a followup to Apex Media which I have.
Rumors in the past say that a working Demo called Apex Alpha or Apex Audio
does exist, and I would love to have a copy of it.

If anyone has it, I would really appreciate a copy of it.

I happen to have the original manual, reference card, and original 2 disks.

Manual says version 1.1, 1Meg of memory is required and is hard drive
installable.

It looks like a interesting program, it can read dBase, ASCII, CSV and
other
file formats such as Lotus and SuperCalc. According to the manual.

Its a rather old program and I have never used it before.
Have you used it before? If not how did you find out about it?

If you cannot find it anywhere else, then I would probably sell it to you.

I have a free chat system set up if anyone is interested in chatting about your favorite computer. I only have a windows client available, but will be working on a linux client in the near future.

To sign up, visit http://boycot.no-ip.com/boycotchat If you don't get the confirmation email after you sign up, email me and i'll activate your account.

To get the client software, visit http://boycot.no-ip.com/software/ and click the "BoycoT Chat Client" link.

Everest is ok, but QED does an excellent job. I am not sure about 1st Word. I would test it out by sending myself an email just to see how it looks. Besides, if I going to use it, I would try 1st Word Plus. It is a lot better than the plain 1st Word and it what I use on my STe.

>Anyway 1 st Word is history. It hardly runs on modern systems.

Yes, I agree here.

I have a Nova Graphics card on my Hades. I use Calamus SL 2006 alot but mainly for person use. I print out my Christmas labels every year. I not only print out the addresses, but also a little Christmas graphic scene. I use a Christmas card(s) that I received the previou year. I scan them and put them into Calamus before printing. I also use it for making up label for my video collection. There is other stuff also. I also use PhotoTip for getting pictures ready for use in Calamus.

The router will have a config section where can be set a range of IP
numbers which will not be set by the router's auto-setting function,
which is what I think you're saying there Martin.

The OP needs to make sure that the TT's fixed IP address is within that range.

I was wrong though about how to set the static address. One
must look at setup/advanced routing. Here can you set the static IP of
the TT.

Well, Photoline ST (or TT) is a GREAT and faster and cheaper alternative
to Photoshop for everyday jobs.
Then I use GEMgraph (not for pure graphics, but for calc/pblishing)
I used OverlayII for title animations. I still thing it's great, but the
low resolution limits somehow its utility (I can use it only in
not-full-screen titling).

Hi Karsten

The UK distributors of 1st Word, GST, published a document
'Software Developers Guide for 1st Word Plus' which contains quite
a lot of info about the format. What did you want to know? I could
send you a photocopy if you let me have your address by email to
xlator AT cix DOT co DOT uk.

Regards, /Peter/

My wife still uses it as her prefered WP program, and I use it at
times for letters etc. You may find it a bit slow for your email
purposes - if you do use it, make sure that you save the text with
'WP mode' *off* as otherwise it will use ASCII 29-31 for spaces
and add a header including a ruler.

1WP *.DOC files import fine in Papyrus and some other DTP programs.

Regards, /Peter/

>
>It does run on the Falcon. But you need NVDI or SpeedoGDOS.

Yes, I still use it for some of my older publications that were
written in TW3. Note that you also need Speedo *.SPD fonts - it
won't use TTFs. Furthermore, it usually caches bitmapped versions
of fonts separately for the screen and printer in larger sizes
(the minimum size is adjustable) which can take up a lot of hard
drive space - mine are 2 and 8 MB respectively. These can be
deleted, but it then takes longer to build up a bit-map before you
can use a font.

It's quite versatile, but I prefer Papyrus as it's more flexible
in things like line and para spacing, and can use TTFs.

Regards, /Peter/

6785. CTPCI and video cards

Newsgroup: comp.sys.atari.st

Message-ID: <pan.2006.05.14.21.18.44.630169@charter.net>
Source record: 8512

I know the CTPCI with a Radeon video card is still very "newish", so what
I'm asking is probably still in the "not sure" stages but...

Will a CT60 Falcon, equipped with a Radeon video card, via the CTPCI still
be able to show/run/display standard Atari video? I mean, if I still
wanted to play a game, will this new setup run it?

Thanks, just trying to get my head wrapped around the concept of any Atari
besides the clones (Milan, Hades, etc) using a standard PC video card. :)

A similar problem is visible in XaAES: realtime resizing of directory windows does not work correctly. This has been fixed now (please see "New after this release" on http://solair.eunet.yu/~vdjole/teradesk.htm) and will be available in the next version of TeraDesk, to be released within a week or so. Most probably the fix will also apply to the problem yopu experienced in Magic-PC.

It will, but on Falcons video port. So u will need either switcher or 2nd
monitor. 2 monitors are not bad idea, i hope that virtual consoles in mint
will run on original video and AES on CTPCI.

Hello All,

I am in process of re-installing MintNet. Things are mostly up and running. I do have get Mint connected to the Internet using my Ethernet card and I have to get X Window running. I used EasyMint and I noticed some files were not installed because of what I think is because the names wee too long. Sounds strange, but that is what I am getting. If I take the X11.tar file and extract it under Magic, things are ok. If I try the same under Mint, I am certain files are not extracted. I am getting an error that the file cannot be created and am denied access. If the name is too long what I can do to fix it? Should I use the ADDMEM program? I use it for Magic, but not for Mint. Suggestions?

Baguette & croissants :)

New version of the pack dev kit environment machin running on Atari ST,
for C coding and building demos & games for the Atari Lynx.

Download on my homepage or directly in the folder
http://rajah.atari.org/files/ -> lynxdev_st020.zip

Modifications in the 0.2.0
- lynxer, make_lnx, bin2c and wav2lsf GFA rewrite
+ lynxer support more than 16 files (see doc)
- sprpck and bin2obj recompiled with PureC (BMP image no more
supported)
- added original version of lyxass

Voilï¿½ :)

Yeah, a very handy especially when you've got monitor with two SIGNAL
INPUTS!
So we need good Drivers then, and maybe good idea is to write to author of
drivers for CTPCI - RADEON. Didier Mequignon his name :)

It is basically question of disentangling BIOS screen output
from VDI output.

I once (many years ago) used TT-Digger for this purpose
on the NOVA VDI.

This VDI took over ALL screen output.
I succeeded in removing or modifying those parts.
The result was that I got all VDI output to the colour monitor
connected to the NOVA card, and all BIOS (mostly printf) output
to the TTM195.

Everything under TOS 3.06 ROM AES.

Thus I learned that the AES exclusively used VDI.
Which was nice. :-)

Unfortunately I made a disastress mistake, totally ruining
the TT-Digger efforts.
Then I upgraded to a ATI MACH NOVA having a different VDI
binary, and I abandoned the lot.

Hi, Lonny!

l> Unless I goofed there should be an MFP doc there.

Sorry, I did expect it in the "Data Sheets" section, did not look through
the "Atari DevKit" section thoroughly. Should have been thinking first ;-)

But this makes me suggest that you link to the gathered documents from an
additional tree that sorts them by contents instead of the way one could
obtain them originally.

Anyway, the link to the /Motorola/ 68901 Data Sheet is
<http://www.datasheetarchive.com/search.php?q=mc68901&sType=part&ExactDS=Starts>.
This PDF is a scan as well, so no big advantage in quality. But it seems
to be more elaborate in the timing diagrams at least.

Regards,

Alexander

I have a TT/MSTE version that you select with a jumper.
What type of Nova Graphics card will work on the Hades?

I have Various DTP programs, and don't use them as much as I use to.
Years ago, I was into PageStream, recently I got a package called
QuickForms for PageStream that has a CD full of Forms, templates, fonts and
etc for PageStream and other DTP applications. There are Calamus fonts on it
as well. This package also came with 2 3 1/2 disks and a manual. Haven't
fully
explored it yet, but it has gotten me interested in DTP again.

It's hard for me to choose which way to go with DTP. I have the full
version
of PageStream, plus extra software and etc for it.
So I can use it as is, knowing I have the latest version.

I have Calamus SL, Papyrus Gold v.5, Calligrapher Gold and a few others.
PageStream is the only one I have really used so I know it well.
Papyrus Gold looks really good to me, but I would want to upgrade to the
latest version. I think version 5 supports colour, but not sure if there
are major
bugs in it that would prevent me from really using it.

I'd like to find a update release notes for each release of Papyrus Gold, Calamus SL,
and Calligrapher Gold. I'm not sure if Calligrapher is still supported or how far any
upgrades went. I also like to know about any printer support. These probably use
NVDI which I have. I like the idea of using a DTP product that can use some of
the latest printers if any. Using NVDI or Not.

I would be using the DTP software on a Falcon. Either with a standard CPU or upgraded with CT2B or Nemesis. Or MSTE with a Nova Graphics Card.

PhotoTip, I don't recall that one at the moment. Is that anything like PhotoLine?

BTW, do you know if Apex Media will run on the Hades?

>

Yes I agree Photoline is good. I was just looking thru a Computer Mag that
I got
in the mail that sells all types of Graphics/Audio software and hardware for
the PC and
Mac. Some of the prices for Graphic software was hard to believe, for
example
AutoDesk Maya 7 Unlimited runs from $7000 to $9000 US!!
It must very nice for that price.
Others run anywhere from $100 to $2000.

I've not used Overlay II before, can one still get the full version?

I have a few Genlocks that I can use for doing titles and graphics in video.
There are software only packages that can do similar results.
BitBopper, can do some amazing things. The full version was released and
still
can be downloaded as far as I know. Every Falcon owner should get this one.

I was requested several weeks ago for a design of a IDE port for STE
machines.
I answered to the french guys that I need at least 100 buyers to do a
design.
And after 1 month, he sent me a list of near 100 guys....

So, it is possible I will design this small simple board for STE.

I take your email and will inform you later...

Okay, I read your other message about the Thing desktop and you're right. That is a limitation of Thing. I've heard rumors that the last (unreleased) version addressed this, but its not available as far as I know. I've got v1.27 as well, registered.

Have you tried Teradesk as a replacement desktop? I believe it has support for those really long filenames, and its still supported and being developed.

That's a Thing 1.27 problem. The latest available version is Thing
1.27. There is also Thing 1.29 - which doesn't have that long file
problem - but that version has only been distributed amongst beta
tester. Some years ago there was in this newsgroup an announcement of
Thomas Binder. He stated that everyone interested in the latest beta
version could get it from him. Since then I wrote numerous mails to
him but never got a reply back. :-(

Anyway if you feel comfortable with Jinnee do use it. It works very
good under MiNT.
Under Thing 1.27 you still can see these too long files names with the
shell.

I mailed Thomas a few weeks ago about that same matter and he sent me Thing
1.29 beta. However, There are still some limitations on filename lengths.
It displays longish filenames, but they are not editable. I haven't tested
thoroughly, though.

Cheers,
JFL

I found out that I do have version 1.29 Beta and it does display the files in question that 1.27 does not. It is only in German however, but that is ok. I want to re-install Mint using Easymint and will give that a try and see just how it goes.

>Anyway if you feel comfortable with Jinnee do use it. It works very
>good under MiNT.

Yes it does work ok, but the color is screwed up. I have N.AES version 2 and Jinnee works best in the 16-bit mode, not the 24 or 32-bit modes. I did try and use it to install Easymint, but it did not work too well.

>are major
>bugs in it that would prevent me from really using it.

YOu should use Calamus SL. It is an excellent program and offers more features
than PageStream. It is a little hard to use, but after you get the hang of it,
it's easy. I also have Papyrus Gold version 10 and it is super.

>upgrades went. I also like to know about any printer support. These
>probably use
>NVDI which I have. I like the idea of using a DTP product that can use some
>of
>the latest printers if any. Using NVDI or Not.

I also have NVDI version 5.03 and an old Epson Photo 700 color printer which
does an decent job. Papyrus and Calamus uses it just fine. There is a separate
module for Calamus called VDIprint which lets Calamus use any printer that I
have set up with using NVDI.

PhotoTip is not really like PhotoLine but then it is. PhotoTip is meant to be
used with a digital camera, but can be used without one. It also will take a
photo and will allow one to change it in most any way possible.

>BTW, do you know if Apex Media will run on the Hades?
>phantomm@bellsouth.net

No, I am not sure. Have not tried that one.

Source record: 8537

Hi all,

In case anyone has missed the information about NAS2006 (Nordic Atari Show), the date has been set to June 30 - July 2. Yes, this year NAS will span 3 days, something that should make it more appealing to ppl that has to travel long distances to get there.

Like the last few years, NAS will be held at Samskolan in Gothenburg. We are told that we can expect more details on NAS from the official website soon, but unless something is radically different from the event last year visitors should be able to access the computer room all around the clock. Last year, those who did not want to waste their precious money on a hotel room could grab their sleeping bag for a nap in the sleeping room.

* To monitor the official website for official news regarding NAS2006:

http://www.sak.nu/nas/index.htm

* To see which ppl that are planning on going to NAS, and to view pictures from previous NAS events:

http://nas.atari.org

Hope to see a lot of you ppl at NAS2006 :)

Regards,

/Joakim

But the problem is that school is stopping in France after July 4th...
So, for people coming from far and having some children it is not possible
to go the Saturday end of morning and go back for Sunday evening !
Not from France at least !

Could you not put this show the next WE ????
I may be able to come....
;-)

Source record: 8545

Hi
I've bought a Falcon with a 16 to 32 MHZ accelerator fitted in it.

The guy selling says the 16 to 32 MHZ accelerator is probably a "Powerup2"
he hasn't been able to locate the software to turn it on & off yet. Can
anyone point me to the utility that does this or to more detailed info on
the PowerUp2 accelerator. I have tried google without much success so far.

regards
Maurice

Hmm, just tried out Jinnee in 24 bit mode. The colors were ok. Under
32 bit mode only the desktop icons were screwed up. The desktop
background picture, menu's etc ... are good.
I don't know if it makes any differents but I'm using XaAES 0.998
instead of N_AES 2.0. I stopped using N_AES since quite some time now.

Folks, we've got 13 player slots left in Final Frontier 2. The game is progressing slowly, so it will probably extend into next month. So I'll add another $25 for a total of $50 then, as the cash prize for the winner.

Watch out for the Satharians! (computer AI). They've already found me twice in the deep recessess of space and slagged me. (curse them and consign them to the netherworlds!). :)

Phew, what a relieve.;-) I thought I was the last Thing 1.27 user in
Atari land. I was already thinking about to ask the status of serious
endangered species.

I wonder how we can persuade Thomas Binder to release Thing 1.29.

6829. Atari STFM 520 4Mb + monitors & boxes of games & Progs (UK)

Newsgroup: comp.sys.atari.st
Date: 2006-05-19 18:42:56 UTC
From: Steve Clark <sd.clark@nospam.btinternet.com>
Message-ID: <nfqdnciJ--8ujPPZRVnyiQ@bt.com>
Source record: 8406

I recently moved to a village near Ely, Cambs and sitting in the garage is
my old Atari ST.

I've not use it in years but have no use for it now.

I'm willing to let someone have it at no cost if collected or a short way if
I deliver it, say 50 miles(ish) from Ely.

It's a Atari STFM520 with a 4Mb upgrade internal. Single-sided Floppy drive.
Mono SM124 monitor + Philips 14" colour monitor with a monitor switcher
attached.
I've also got 3 large boxes of programs, games etc, Calligrapher etc.
A handheld B&W scanner too. A few books also.

If there is anyone that would give it a good home then please email me.
But take out the "nospam." from the email address.

Steve Clark

Hi
I really appreciate this Rustynutt. Does this also turn off PowerUp2?

On the TT version there is also a seperate program to turn PowerUp off & a cpx utility as well.So it looks like I'm looking for the prog to turn Powerup2 off, the cpx utility and some docs if possible. So far so very good.

regards
Maurice

You really must do that some time. You won't regret it. Sure there are
some issues that needs to be solved but XaAES as it is today is very useful.

I really don't have any reason at all to return to N_AES.

I concur with Martin and indeed use Jinnee with XaAES and it works perfectly
well except for the lack of backgroud images. But this may be due to fVDI.

Cheers,
JFL

Message-ID: <pan.2006.05.20.22.49.21.194192@caramail-NOSPAM.com>
Source record: 8418

Hello,

SDL 1.2.10 was officially released this week. New and fixed stuff:
- Added unicode character code support in keyboard drivers.
- Keyboard/mouse management with XBIOS interrupt disabled under MiNT (can cause crashes).
- Added driver for /dev/mouse in MiNT, but disabled at the moment (not usable with other applications at the same time).
- Updated for mintlib 0.57.6.

And for the first time, I also ported some other SDL helper libraries:
- SDL_mixer 1.2.7 (for music and sound replay)
- SDL_image 1.2.5 (for image loading)
- SDL_net 1.2.6 (for network)
- SDL_ttf 2.0.8 (for truetype fonts)

Everything is available on my website now.

It appears I wasn't clear? I was stating in the other post that with XaAES/fVDI
background images weren't displaying right. I've never said Jinnee
couldn't do them at all. We were talking about XaAES "issues" versus NAES.

Cheers,
JFL

Didn't the authors of Pagestream port that over to the PC and Mac
market ??

Seems to me I heard they were still around and working on Pagestream
for the Mac. It was a superb DTP program for the time.

That's Write from Compo Software in the UK was my WP of choice for as
long as I used the Atari - a great program - and the supposrt crew,
Neil O'Nions and his folks, were fabulous.

Probably yes. Jinnee does display background images on my Hades using
novaVDI

CU,
Martin.

6849. Atart 1040ST collection for auction

Newsgroup: comp.sys.atari.st
Date: 2006-05-21 18:35:19 UTC
From: Hunter Moon <runedancer@yahoo.com>
Message-ID: <1148236284_6535@news-east.n>
Source record: 8426

I have up for auction on ebay my Atari collection.

This auction is for an Atari ST collection. Everything is sold as is,
but is in good working and cosmetic condition.
The collection contains the following items:
• Atari 1040ST computer
• Atari SH204 hard disk drive (20 MB, I believe)
• Atari SM124 Monochrome Monitor (bright and crisp)
• Atari SC1224 Color Monitor (bright and crisp)
• Monitor Master A-B switch to select between the monichrome and color
monitors
• Atari two button mouse
• Atari joystick (not pictured)
• Over 110 3.5" floppy disks worth of programs
• STation (a support for the monitors and also to house the drives)
• Spectre GCR Magic Sac Macintosh emulator

Here is the URL:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=8815716181&rd=1&sspagename=STRK%3AMESE%
3AIT&rd=1

Email

me with any questions you may have.

Hi Jean-Francois!

> It appears I wasn't clear? I was stating in the other post that with XaAES/fVDI
> background images weren't displaying right. I've never said Jinnee
> couldn't do them at all. We were talking about XaAES "issues" versus NAES.

And that is still not clear:

I do use jinnee + XaAES on a Milan and on aranym.

Milan: background images nice and fine
aranym: background images do not work

The only software difference in the 2 setups is the VDI. On Milan it is
NVDI, on aranym fvdi.

Now it is clear whose fault it is.

Of course jinnee can do background images! It even has some cool
feature, that you can
a) use a background pattern
b) use a picture (on top of the pattern)
c) use a mask for the picture

So clearly, jinnee is very decent with background images!

Cheers, Ingo =;->

Hi
Thanks for your help.
I've checked the TT cpx utility it seems to work. Also now have a TTP prog
to switch it off. So that's that sorted.
Had a dabble accessing the internet with CAB last night - very nice,
although
speed is best described as sedate even with the acceleration.

cheers
Maurice

6864. 11 Reaons why the ST is better than the Amiga

Newsgroup: comp.sys.atari.st
Date: 2006-05-22 13:04:22 UTC
From: techie_alison <retro@dial.pipex.com>
Message-ID: <XrWdnYdmvfioKOzZRVnyug@bt.com>
Source record: 8441

Having bought an Amiga A500 to further develop PeST with, here's my observations;

1. The ST's PSU is internal, the Amiga's isn't.
2. The Amiga has no reset switch.
3. The Amiga has a box to connect to for TV out, then you need more leads.
4. ST FDD is 1/2 height, Amiga's is 1/3 height.
5. Amiga uses hex screws to get into it, ST doesn't.
6. Metal shielding in ST is thicker, Amiga shielding is deadly sharp!! :(
7. Amiga yellows more severely than the ST.
8. ST is neater in design.
9. Strange memory arrangment on the Amiga, chip ram, real ram!!, i don't know??
10. Workbench 1.3 boot disk is STILL copyrighted!!
11. Amiga disks can't be interchanged with a PC without gizmos

So I have an A500 with no Workbench/Kickstart disks such that I can't do anything with it. You can't even get images of the things off the net, and if you could, you couldn't put them to disk.

Sorry to say it but the Amiga get's the thumbs down, I want to throw this thing in the bin it's so frustratingly awkward.

If I didn't know better I'd say it was a commercial copy of an ST. The ST has a much nicer corporate feel to it. The Amiga is for children to play with.

The most famous word I have ever/always heard about the AMIGA, is the mentioning of the famous graphic capabilities. And that famous Gfx is the same generation, who made the ATARI 400/800 famous, and the mighty VCS. XL. XE (already Tramiels) ... and so on. 260ST, 520, 1040 etc...

Best Regards,

Daniel Mandic

The dongle was for copy protection on early releases of DynaCADD. It
was abandoned on later releases, I believe -- at least its not needed
on the version I'm still using on my trusty 'ol TT030 (vers. 2.04.06).
As I recall, the dongle plugged into one of the serial ports, but
check your documentation to be sure.

Im hardly seeking one interesting programm for ATARI ST. Anybody ever heard about UniSpec, a succesor of Spectrum 512 graphic editor?

Maybe somebody still got this stuff?

Thanks in advance for any infos.

I'm no software developer to speak of and Thomas replied when I contacted him
a couple of months ago at the address he uses on the MiNTlist. Maybe you weren't
polite with him? :-)

If he reads this thread he must find this discussion rather amusing.

Hmm, who knows but if so this was certainly not on purpose. English is
not my mothertongue and my poor knowledge of English is not always
sufficient enough to express me properly.

And so did I. I paid for the regular Thing version and I paid twice
for the N_AES version.

Not sure but I believe I got the registration key from InterActive
(Joe Connor).

>out there. What is the latest version. I am using 1.27.

1.27 was the last released version (though 1.29 was announced as a
beta and reputedly available for download, though I never managed to
get it). 1.27 accepts filenames up to at least 33 characters long
(before the point) on the desktop, and permits spaces. However it will
not take that length in the 'Show Info' dialog. For longer names, use
jinnee, which permits 64 character filenames.

Pagestream is still around for pretty much everything except the Atari
-- http://www.pagestream.org/ .

I just purchased an iBook yesterday to replace my aging Powerbook
3400c, and I'm pondering whether to purchase Pagestream 5. I have been
told by customer service that PG 5 can import Atari PG 2.2 formatted
files.

Has anyone else here used PG 4 or 5?

Galen (who played Towers with his son yesterday using dual Falcon 030s)

>Well is the author working on this?

Well, contrary to what some people seem to think, I'm not a psychic.
It's usually best to actually tell me about problems rather than to
just assume that I will learn about them by magic. ;-)
(I fixed a bug concerning 32+ open virtual workstations just a
couple of days ago after being told about the issue.)

Anyway, it does indeed sound very likely that the culprit here is
fVDI. Probably an effect of the currently somewhat limited support
for the NVDIv5 blit functions.

Could you tell me in more detail how this problem occurs?
Can I find a downloadable demo of the relevant desktop program?
Is it a problem with all colour images, or only non-bitplane ones?
Does it occur in all screen modes? Only bitplane? Only true colour?
Any debug output from fVDI? Even without normal debug output turned
on, it is supposed to diagnose vr_transfer_bits problems. You might
need to redirect the output to some suitable place to see it, though.

Even if you chose to continue this discussion here, I'd appreciate
if you sent me an email (johan@klockars.net). I don't look in on
c.s.a.st as often as I perhaps should these days.

Btw. TeraDesk accepts filenames up to 127 characters long (complete paths
up to 255 characters), including spaces and quotes.

However, desktop icons in TeraDesk can have labels only 12 characters long,
so such filenames are severely shortened when displayed on the desktop
(middle parts of names replaced with "...").

6877. ATARI ST PAL games on NTSC machines?

Newsgroup: comp.sys.atari.st
Date: 2006-05-23 04:52:17 UTC
From: Rinaldus Drybone <rinaldus_drybone@lycos.de>
Message-ID: <1148359937.459431.165060@38g2000cwa.googlegroups.com>
Source record: 8354

I have a question about PAL and NTSC games :

Will PAL games work on NTSC machines?

What about games which use the higher
PAL resolution, that means opened borders
or something like sync scrolling?

I know that NTSC games work on PAL machines.
Some do switch to 60Hz, but that's no big deal
when you have an SC1224 or some RGB monitor.

6878. FA and FS: Spectre GCR and other Atari goodies

Newsgroup: comp.sys.atari.st

Message-ID: <PbCdna95d4hwnu7ZnZ2dnUVZ_tidnZ2d@comcast.com>
Source record: 8355

I have put up for auction on ebay a Spectre GCR (Macintosh emulator for
the Atari ST), including the 128k Mac ROMs and all documentation/software.

Item #8815815083
http://cm.ebay.com/cm/ck/1065-29296-2357-0?uid=40782990&site=0&ver=LCA080805&item=8815815083&lk=URL

I also have the following for sale in Dallas, TX, USA. If you're
interested, let me know if you have any questions, or make an offer and
we can discuss shipping. :) I can email pictures if desired. I will be
putting these items on ebay as well within the next couple of weeks.

- 520 ST
Rainbow TOS 1.04
AERCO easieST RAM upgrade, 2.5MB RAM total RAM
Has a couple of broken keys on the keyboard

- MEGA ST4
TOS 1.02
4MB RAM
Includes working keyboard

- SM124 Mono Monitor

- SC1224 Color Monitor

- Hard disk enclosure with ICD adSCSI-Plus SCSI host adapter, 44MB
Syquest removable drive (incl. 2 disks) and 80MB hard drive
(I also have a non-working ICD Advantage-Plus SCSI host adapter - which
AFAIK is an older version of the above but functionally the same. It was
working when I first pulled all this out of the boxes, but I seem to
have broken it. :(After initial successful testing, it started causing
the Atari to bomb during bootup.)

- Two functional Atari ST mice

Please direct any replies or questions to "mbrunt at yahoo.com". Thank
you very much!

Micah Brunt

I just tried loading 16 and 256 colours images and without debug
on I get this from fVDI beta 7:

v_get_ctab_id not yet supported

Since I'm the one who first mentioned the fact that Jinnee doesn't display
colour images under fVDI, I'l take a closer look and mail you with a
more complete bug report. I haven't bothered you with that since it is
not very important to me.

And yes, a demo version of Jinnee can be downloaded from ASH's website:

http://www.application-systems.de/jinnee/index.html

Hi again,

Today the Swedish Atari Club posted additional information regarding the upcoming event on their website. Nordic Atari Show 2006 is the Swedish Atari Users Association's annual convention which consist an excellent opportunity for all Atari entusiasts to get together, make new friends and make developement progress, and of course, have a great time!

The theme for NAS will be CT60, EtherNAT, FreeMiNT and XaAES. If it will be anything like last year, we should be able to expect several CT60's in action. Developers of EtherNAT (Nature) and XaAES (Ozk) will be present, as will Nick Harlow of 16/32 Systems.

NAS will be open from June 30 6pm to July 2 3pm. If you just like to visit NAS without bringing any equipment the best times will be from 10am to 7pm on saturday and 10am to 2pm on sunday.

* To review all the details about NAS2006, please visit the official NAS-website

http://www.sak.nu/nas/index.htm

* To see which ppl that are planning on going to NAS, and to view pictures from previous NAS events:

http://nas.atari.org

The answer is yes ... (usually at least).

I have several games I purchased mail order from England. (I'm in the USA.) They all work on my STe/SC1224 combination, since the monitor can switch to 50 Hz. (Unfortunately, I can see a flicker at 50 Hz, but it isn't too bad -- your eyesight may vary.) On the other hand, I don't know if all PAL games can be so played. It could be that all the ones I purchased were intentionally written to be compatible.

Source record: 8361

All,

At one point I was the caretaker of the Suburban Chicago ATari public domain software. In order to save space, I stored all the files on a QIC-150 using tarfile format (created with MiNT).

Anyway, I no longer have an Atari, SCAT no longer exists, and I don't want to just pitch the tape. Anyone in the DFW (Texas) area who wants it can pick it up. I'll ship it for shipping costs.

BTW, I haven't looked at this tape in a while as I no longer have a QIC-150 drive (otherwise I guess I could just upload it). So buyer (or picker-upper) beware.

Email or 817-427-2129.

Thanks.

They do now with fVDI as well (I've only tested 32 bit mode, but the
rest should work too). :-)

>> fVDI. Probably an effect of the currently somewhat limited support
>> for the NVDIv5 blit functions.

I turned out that Jinnee didn't use the NVDIv5 blit functions after all
(but it did use vq_ctab, which I had forgotten to finish up).

The main problem was that Jinnee used plain old vrt_cpyfm (mono expand blit)
in a somewhat strange way to convert the background image to something
that could easily be blitted to the screen.
I'd forgotten to check for non-screen destination in that function
(vro_cpyfm has done that for a very long time), so it clipped against
the clipping rectangle even when the destination was ordinary memory
rather than the screen (which may sound reasonable, but it's not supposed
to do that).

>I just tried loading 16 and 256 colours images and without debug
>on I get this from fVDI beta 7:
>
>v_get_ctab_id not yet supported

That function is indeed not implemented yet, but it shouldn't really
matter in non-paletted screen modes (it is apparently meant to be used
to let you know if the palette has changed).

>Since I'm the one who first mentioned the fact that Jinnee doesn't display
>colour images under fVDI, I'l take a closer look and mail you with a

No need. It seems to work fine now. :-)
Just download the latest FVDI.PRG from my web site.

Several manufacturers made RGB cables for ATARI XL/C 64 and AMIGA. I
have both. Makes an excellent picture with my XL....

Audio can be connected even better and easier, via cinch. Although,
that cable-replicas for the mighty AMIGA are including cinch-connectors
L-R! That means Audio via Scart.

Best Regards,

Daniel Mandic

Too bad!? Are you kidding me? He's still in business - which is a good
thing!
Ask the dude nicely and he'll give it to you (if you've registered
v.1.27).

Try the right address. I repeat - try the right address. He's on the
mintlist.

One more thing - if you people want this stuff to be free - try to
convince the author to release it under GPL.

regards

You could also add that the monitors for the ST give a much clearer picture
than the ones for the Amiga. I admit I have never seen an Amiga monitor, but
this is something I have heard for years...

I don't care at all if I've to pay for it. It's a nice and very useful
piece of soft for which I would happely pay a fair amount of money for it.
But as the author doesn't answer too me ...

Kind regards,

Martin

No it was not TeraDesk's fault. It had something to do with dependancy.

lol :-)

10 reasons why my spectrum is better than the ST:

1. It's black
2. It's got rubber keys
3. It's got a separate PSU.
4. It's got a built-in speaker
5. It has a direct-CPU expansion slot
6. It's tape-recorder-compatible
7. Memory arrangement is straight forward unlike ST/TT-ram
8. Built-in basic
9. Doesn't require a mouse
10. The speccy key-click is nicer than the atari-bip

Well.. seriously. Don't get me wrong. I like the Atari line of
computers. I have a F030/CT60 and a Hades which I use every day.
However, to be honest - the Amiga 500 hardware was far more technically
advanced than the 520ST/STE was, in allmost every aspect. I could never
admit that at the time, however...

Hmm, I've got 2 slighty different addresses like that - I know he did send
me the registration key just last year on one of them (I had registered
years ago, but lost my key - fortunately, Thomas remembered, and still had
me in his database), but I'm not sure now which one?

Here they are:

g<SPAM>ryf@hr<BLOCK>z.th-darm<REM_OVE>stadt.d*HERE*e
gr<REMOVE>yf@hrz<SP_AM>pub.tu-darm<BLOCK>stadt.d*THERE*e

Not in MIDI. Nothing can compare to a ST, only humans... due to more individual play - in meaning of dual. ;-)

Games on ST are also O.K. (Dungeon Master, Chaos strikes back, Elite, Bloodwych, Bard's Tale, Kaiser, Bitmap Brothers)

I think many know the advantages of either System.

Wouldn't like to buy one would you?? I have a 16k one boxed, immaculate,
and purchase complete. Would throw in a 32k rampack, Ram Turbo interface, a
Competition Pro joystick, JetPac, JetMan, Atic Atac.

About £40 for that lot including postage via insured courier.

Also a 128k+ (heatsink one) which is boxed and purchase complete too, with
say Ram Turbo interface, Nodes of Yesod, Robin of the Wood. That one I'm
likely holding onto though :(

But the speccy is brilliant. Back to the Amiga, I just don't like the feel
of the thing, technologically advanced or not. Admittedly the Ammie board
is quite bare compared to the STs. Oh and the ST ran faster ;-)

Unispec is an upgrade for Spectrum 512.. It requires at least version 1.01
of spectrum.prg for merging. Unispec can be run as an acc. Requires 1MB
machine to be used with another prg. Manual says it works with Neochrome,
Degas, Degas Elite, Cad 3-D, Cyberpaint, Computer Eyes, Digispec and others.
I assume like Spectrum 512, it can only be used on an 8mhz machine. Boot prg
checks chip synchronizing.

I have Spectrum 512, Unispec, Computer Eyes(digitizer) & Digispec.
Apparently I've forgotten almost as much as I knew about them. I think most
people would need the manual. It's 94 pages and refers back to the Spectrum
512 manual.

Spectrum
> 512 manual.

Well actually there is no real need for manual.

Typicaly if you want to use UniSpec with DegasElite, all you have do do is to get the "spectrum 512" to run as a desk accessory (using unispec), then when you run Degas Elite you can exchange data between the two programs.

I always considered Spectrum 512 as a magnificient piece of engieneering, but with a terrible ergonomy (programmers design at his best). In comparison Degas is slow, but way more practical to work with.

Associating the two programs makes it possible to draw (for example) "sprites" or shapes in 16 colors using the comfortable tools of Degelite, then you select them as blocks, and you go back to the main gem interface, and in the deskaccessory you have one line with various acronyms, depending of where you click spectrum will intercept the command, for example "import the current degas elite block as a block in spectrum 512". Then the control is transfered to spectrum and you can move the block.

One particular usage of this is compositing, ie the creation of 512 colors pictures using copy-pasting of 16 colors items.

: You could also add that the monitors for the ST give a much clearer picture
: than the ones for the Amiga. I admit I have never seen an Amiga monitor, but
: this is something I have heard for years...

Ancient history: The internals, and the mounting surface, of the
monochrome monitor were the same as those of the mono monitors used for
NCR banking machines. The mounts for those machines fit, if you can get
the part number, which apparently can be done in Germany.

Same for the color monitors. The externals varied a bit, but the workings
and mountings were also found on NCR bank machines.

I learned most of this in the process of getting a mono monitor tube
regunned by a tube rebuilder.

Hi,

Yes, I have mint 1.16.3 and 1.15.12. I have tried with Odd to install
XaAES but it's not simply for me, and I have cancelled this project...

It's the reason why I have N.AES 2 with Mint 1.16.3.

Thanks for your answer,

Cyril.

It all depends on the definition of "faster". Raw CPU power was somewhere around 90% compared to that of an ST. On the other hand, the Amiga could play sampled multichannel sound and move stuff around on the screen without using any CPU time at all. We had to do all this using the CPU, causing lower framerates, bad sound, jerky scrolling, less colours...

I'd say the fun started with the F030.

btw, I have all the Speccies I need :-) 48k, 128k, +3, Beckman 2000 (rare Swedish speccy clone thingy with better keyboard. Standard 48k + swedish ROM inside.)

6938. Lowdown on SCSI drives?

Newsgroup: comp.sys.atari.st
Date: 2006-05-29 14:52:04 UTC
From: techie_alison <retro@dial.pipex.com>
Message-ID: <jlSdnXVzc6pxlebZRVnyhA@bt.com>
Source record: 8315

What is the arrangement with SCSI hard drives and the Atari ST? I've just acquired an ICD LINK adapter and am trawling the web at the moment for lowish GB SCSI1 50-pin drives.

The Seagates seem to come out top as there's specifically a 'parity' jumper on them.

Can 68pin or 80pin drives be used with an adapter, or does the 16bit transfers create an issue?

Would it be possible for someone to give me an idea of what I'm looking for? As trawling eBay at the moment I can pick up plenty of these Compaq ultrawide drive pulls, assuming they have a SCSI1 mode and can perform 8 bit transfers.

The ICD Link btw will recognise my SCSI Cumana (was for Acorn BBC Archimedes) drive, so is assumed to be functional.

Thanks kindly in advance,

Aly

Greetings all,

I picked up from a packrat the other day (3) Supra External Drive kits
that use SCSI drives and have 20MB drives in them. These plug directly
into the HD port in the back of a 520/1040ST and allow you to get away
from the floppy disk.

Asking $30/each for them.

Drop a line to aristuff (at) 00100100.net for arrangements. Will
ship anywhere except Nigeria for the obvious reasons of phishing.

-D

I've successfully used a SCA 80pin to 50 pin adapter with my Atari TT030 and
a Seagate ST34572WC drive.

A couple of others didn't even get recognized, like a Quantum & DEC.

I've also used an IBM DCHS drive too.

Alan.

No, there are no issues to be expected, you just need an adapter.

> ultrawide drive pulls, assuming they have a SCSI1 mode and can perform 8 bit
> transfers.

Any 16-bit SCSI drive should support 8-bit transfers.

I am not sure of the Link supports SCSI command passthrough. If it does then almost any SCSI drive should work. However I suggest that you get a copy of HD-Driver. I have a TT-030 which has a built in SCSI adaptor. I have a pile of (8 I think) 1 and 2Gbyte SCSI drives next to it. I also have copies of several version of AHDI, CBHD and HD Driver.All the SCSI disks in the pile work on a PC with an Adaptec SCSI adaptor.

However on my TT only HD Driver works correctly with most of the drives. AHDI almost always sees the drive, and appears to format them.. But it won't ever create a partition. CBHD sometimes creates a partition but then manages to corrupt the data. After all this messing around I began to think my TT was duff. However I managed to create a partition with CBHD and the demo version of HD Driver then accessed this flawlessly. So I bought a copy of HD Driver and all seesm great. I must admit I don't use the thing very often these days....

> The ICD Link btw will recognise my SCSI Cumana (was for Acorn BBC
> Archimedes) drive, so is assumed to be functional.
>

I would think so. Would you like some samples from my pile of SCSI drives. If you want I'll format a couple up with HD Driver (but not install the driver) so you may then be able to access it with the demo version...

Folks,
As I need to create space in my micro sized computer room, sadly I have
one or two ATARI bits that are going to have to go:-

1) MEGA ST2
Original MEGA ST-2. and keyboard. Sorry no SM124 that died some time ago.
Internal floppy is single sided. See below for extras.
Not sure if I have a working mouse:-(

2) Ethernec and RTL card. Built and supplied by Lyndon

3) External cumana floppy drive. (came with Mega)

4) SCSI Ethernet adaptor.
Only works with STING and real SCSI port. Tested on my TT.
Needs 12v PSU

5) external home brew Hard Drive (BBDP interface I think it has a 60Meg
Drive),
Works but looks a right mess :-(

Also have box of original START disks plus some games,

I assume the above work, but I have not used for ages so will test before
dispatch....

Any offers considered. Would prefer buyers collect. If I get lots of offers
(some hope I Know) I reserve the right to E-Bay it as I think that would be
the fairest way to dispose of it....

Dave.

> ever create a partition. CBHD sometimes creates a partition but then manages

Yes, HDX is known for often reporting that it could not write the root
sector, and in this case it is impossible to create a partition. But
even if AHDI were able to partition a drive one would not have much fun
with drives bigger than 1 GB because AHDI cannot access more than the
first GB of a SCSI drive. AHDI does not know/use the SCSI commands
required for accessing sectors beyond the first GB.

> I would think so. Would you like some samples from my pile of SCSI drives.
> If you want I'll format a couple up with HD Driver (but not install the

Note that formatting a drive is never required if a drive does not have
bad sectors. Depending on the drive formatting can take a long time.
Partitioning a drive is always sufficient, even if it was previously
used with another platform, because partitioning creates new filesystems
and simply overwrites any old stuff.

And its so long since I ran this I am thinking in PC terms where FDISK only
creates the entry in the partition table, then you do need a "high level
format" to build the empty file system, rather than a low level format as
done by the ST utilities....

Correct,

I found out that the later version did not require the dongle.
I have 2 versions, 1 that uses the dongle and 1 that does not.

You do not have to test for bad sectors unless TOS (i.e. the driver)
reports them. SCSI drives, in particular, manage bad sectors on their
own without your noticing it, and they automatically replace bad sectors
by spare sectors.

Uwe,
Having just spent a lot of time sorting out a dead hard drive on my pc,
albeit an IDE one, I hope TOS does better reporting of bad sectors than
windows :-(
Dave.

TOS (actually the hard disk driver by having TOS display the error
message) reports an error as soon as the hard disk drive reports it to
the driver.

Source record: 8335

If i remember correctly all you have to do is rename the powerup2.prg
to something like :

powerup2off.prg to switch it off
powerup2on.prg or powerup2.prg to switch it on

I had Stoop (boot manager) to do this for me and never used the CPX

I had a led to tell me if it was on or off and i could run the powerup2
program without rebooting. Gives about 10% increase in general as it
has no bus speed improvement just CPU 'overclocking'

Maurice wrote:

Date: 2006-05-31 12:45:16 UTC
From: Ivan Capan <capicnjuz@kset.org>
Message-ID: <slrne7r3us.pnn.capicnjuz@marvin.kset.org>
Source record: 8337

I have lots of files on the PC with a .ST extension and I want to
transfer them to floppies. Is there a way to put the floppy in Atari,
which is connected with PC in some way (I have a null-modem cable),
and use some program to write the image byte by byte to Atari onto
its floppy drive?
I used wfdcopy with PC floppy drive but it was unreliable, throwing some
errors, bad sectors etc. Floppies were HD with hole taped over to make
them DD. Probably troubles with PC drive. I had some DD floppies but I
got the same results.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.atari.programmer

A friend of mine has had his hard drive die inside of his ST Book. There's
a few questions that I hope some experts here may be able to answer.

Do you know by chance if the format of the drive is the same as the regular
ST or if it is the same as the TT/Falcon?
Since the drive is IDE, can any drive be used in it or does it require
certain models?
What means will the drive need to be formatted and with what software is
recommended?

Appreciate help anyone can give to answering these questions.

>got the same results.

Dooes the ST have a HD. If so, use StarCall on the ST, a Null modem cable and a Telcom program for the PC. You can also use Ghostlink for the ST which is designed to work with the ST using a Null Modem cable. If you cannot find it, email me and I will email it to you.

Hell everyone,

Well I have Mint up and running including X11. Now all I need is to get my EtherNet card working. I have the driver from Ozk and it works fine under MagicNet, but I just cannot seem to get it working under Mintnet. The first time I tried it, it worked fine but for some reason I cannot get connected. I know I need to run the PCI_BIOS program. I have that boot up before the Mint Program. Everything loads and then I get to a point where it says: "loading interfaces" and then nothing. Just in the boot process is everyone else putting the PCI_BIOS program? Also, MagicNet also requires me to rename the PCI_BIOS.prg to PCI_BIOS.DEV and put it into the Xtension folder.

Another question is about memory protection. I have tried to use it and I am not told (in the booting process) it cannot be done. I would think it was some program I was trying to boot that is causing the conflict.

Anyone have any suggestions/comments?

Hello again,

I just noticed I type "Hell" at the beginning. Sorry, it was a mistake. I just
wanted to mention that I partially solved my Internet connection problem. I
found told files (drivers for my Ethernet card) that I believe Ozk
had specially made for me. When I used them everything worked to a point. I
can now ping my computer, the router and my wife's PC. I just cannot get out
into the Internet. I am tweaking things to see if I can solve the problem.

Ever heard of copyright laws?? Prove you thought of it first and he hasn't a
leg to stand on! I guess you didn't patent your creation either?!?

Bought mine from you and have no complaints whatsoever. Works perfectly on
my STe even with an optical PS2 mouse.

Chin up

I would also feel agreeved in your position, however as Patents are not cost effective for new Atari related products and Copyright largely pertains to written products and images it is probably too expensive and too much hassle to get anything done about it unless you really really feel strongly about it in which case talk to a solicitor as you may have a case under the "passing off" clause. If a solicitor does feel you have a case under passing off a strongly worded solicitors letter threatening to take action might make him stop selling them or agree to give you a percentage as a form of compensation for your loss of sales but that is probably about all you can do.

Stephen Moss

Maybe, er, reduce your price. His is only £8.99 incl del and yours is
£22.85. That's quite a
difference.

Mathematics is not one of your strong points, yes?

£7.99 starting bid (it's an auction, where as Alison is offering Buy
it now).

Assuming it sold at £7.99 the cheapest postage is £2 within the UK,
bringing a total to £9.99

Simon

I suppose, if you want to get technical, Bravo Sierra Computers isn't really an adoption agency, as adoption agencies typically don't sell their adoptees. Perhaps Bravo Sierra Computers would be best described as an Atari Pet Store. A place where you can buy your favourite Atari pets. Although it would probably be even more accurate to describe BSC as an Atari Humane Society -- A shelter unwanted and stray Atari computers and peripherals.

I suppose if you were feeling particularly insane, you could refer to a garbage bag as the Dr. Jack Kevourkian of Atari Computers. And I suppose that would make garbage pickers radical activists that oppose euthanasia.

Hmmm, so what would that make Jack Tramiel? A Doctor Morgentaler? Yeah, I guess it would. That would make Jack Tramiel the man that performed abortions on countless Atari computers in their first trimester.

Hmmm, following that logic, Nolan Bushnell would be the father that walked away from his bastard child before it was born. So Warner Communications would have been the single mother who raised the 400, 800, and XL machines on welfare before abandoning the children at the Tramiel orphanage.

Wow! So dirty old Jack fathered the XEs and had a vasectomy. So Jack Tramiel wouldn't have been the abortion doctor after all. Rather, he was the man that decided XEs would be his only 8-bit children.

Crazy? Yeah, but don't tell anyone. It'll just be our little secret, okay?

His postage isn't tracked for one, so a negative there. I have the
experience of selling the things over the past year and in sorting out the
muddles when you have a heavily modded ST. He tells us practically nothing
about it.

If anyone wants to buy the parts of the remaining PeSTs, about 100 PCBs
(which are the expensive bit), then make me an offer.

I don't need this crap. If people want to thrash the price down until
they're left with things built as cheaply as possible then buy a Windows PC
and watch it crash all day.

Thx :)

Not hugely concerned really after thinking about it. The aftersales here is
also included in the price and proven :)

I guess that though people would prefer lower prices they also accept that electronic devices produced in small series are moreless expensive. Your way of presenting PeST to the public, your helpfulness and the PeSTs reputation of being a quality piece of hardware should convince any Atari enthusiast. And I suppose that this can be read from your sales numbers and the feedback from your satisfied customers.

So keep on your good work and don't think Atari folks only decide with bargain buys in their minds.

Regards,

Alexander

Hi Roy,

I recognise that name :)

What sort of cable would you like, as there's different sorts which can be
done;

#1. Straight ST to VGA adapter. Cheapest. Simplest

#2. Straight ST to VGA cable. Less strain on the ST port, cable easy to get
hold of

#3. ST to VGA cable. Potentiometers for RGB, allows mono display in any
colour on screen.

#4. ST to 15 way D-Type, allows VGA or RGB monitor to connect with another
lead. Eliminates any strain on the ST.

#5. Multisync box which plugs into #4. Allows a multisync monitor to work
with mono and colour, switch toggled.

#6. Multisync box which plugs into #4. As per #3 which has the addition of
any colour on screen in mono.

Well that's about it really. The price for something like #3 would be about
the £20-25 mark.

Lots of options :)

Aly

Agreed. Trouble will Eiffels is that the use needs to pull the computer
apart.

To build Eiffels would definitely need fresh investment, a couple of hundred
£ for the PCBs alone. Quite a bit more component hungery and more expensive
that PeST.

A few have been built here and boxed, did 3 actually, £50 each.

I think PeST is quite safe :)

:) There's a few more bits which I could do with the ST if I believed the
potential demand was there;

#1. Full blown multisync monitor hookup/control boxes
#2. Floppy disk drive LCD display track counter
#3. SCSI host adapter (being mulled over at the moment)
#4. IDE ACSI interface/convertor (after 3, not as easy as it sounds)

Probably the #5 and #4 setup if I can find a Multisync monitor, if not a
Multisync I would still have the mono capability..

Okay folks, the May 2006 winners are:

1. PEST mouse interface - Zeptari!

2. 1 mbit flash cart - almostrice!

3. ST Magazine - J_D!

4. Final Frontier II - None, game will continue this
month, with a $50 cash prize!

Congratulations to all our winners! :)

The June 2006 prizes are:

1. ST Magazine - 1 lucky Atari caller will win a free
3 magazine subscription!

2. Final Frontier II - game continues from last month,
cash prize now up to $50.00!

Good luck to all! :)

t> :) There's a few more bits which I could do with the ST if I believed
t> the potential demand was there;

That sounds much better to me ;-)

t> #1. Full blown multisync monitor hookup/control boxes

Due to the lack of new low-frequency multisyncs I guess that simple ST-VGA-adapters for b/w and (or combined with) ST-SCART-adapters for colour were more widely usable. No idea what trickery "full blown ... boxes" would include though...

t> #2. Floppy disk drive LCD display track counter

Nice gimmick. And that's the point, I'd expect not many of these would be sold. Though really a nice gimmick.

t> #3. SCSI host adapter (being mulled over at the moment)

THAT really is a long awaited project that surely will sell in big numbers. Think about the fact that it is fairly hard to get your hands on ICDs LINK2 adapters... On the other hand your product must be compatible to the LINK2 - or even more advanced. Nice features were configurable SCSI-ID for the "Host Adapter" itself and support for wide SCSI or even SAS, but that might be "too much" as well.

You should talk to Uwe Seimet about this.

t> #4. IDE ACSI interface/convertor

OK, that's the next step, but:

t> (after 3, not as easy as it sounds)

Here you're very right. You had to implement a controller executing the ACSI/SCSI commands and translating them into IDE signalling - AND to cope with masses of differently behaving devices. Not an easy task. And remember, there are SCSI->IDE converters available, not cheap but available. So if #3 was done you would re-open this way already...

Regards,

Alexander

The IDE/CF side is already done. It's the ACSI/SCSI side I still (note still) need to get round to, a bit of can't be arsed being evident.

It wouldn't really be possible to surpass the ICD host adapters, just maintain compatability. Not sure how fast I can process information though. A 40Mhz microcontroller yeilds about 10million cycles flat out, and once you factor in instructions taking more than one cycle, you're looking at about 2.5 million odd instructions per second. DMA limitation is about 1Mbyte/second so gives 2.5 instructions per byte there abouts. Moving onto the ultra fast TQFP package microcontrollers brings new problems such as soldering the things and track layout.

But they do all use the same mouse ports, so should work on all STs. In fact
the Keyboard interface is the same on all Atari's, appart from the actuall
motherboard connector which is why Eiffel's will work on any PC.

0) A SCSI Adaptor woiuld be a really usefull addition. I wonder if you could
do a box with hard drive interface and ethernea (ASCI => Ethernet)
in in the same box or on the same PCB. Not sure if ASCI passthru is needed.
Does any one still use old Atari laser printers?

1) As the Falcon has an IDE interface, what about an IDE interface for ST. I
know this is harder to make universal as it needs to go on the CPU bus and
Atari use a range of CPU types and sizes.

One trick way is to use STTOMSA on PC. This will convert ST format disks
into Magic Shadow Archive files. You can split these over multiple floppies.
You can then use MSA on the Atari to re-construct the disks. That way you
write the disks on the ST and don't try and force the PC Floppy Controller
to do unatural acts such as write oddly formatted sectors. You can get
STTOMSA from :-

http://members.fortunecity.com/dahstra/atariarc.html <but scroll past the
malware at the top down to MSA utilities.>

and MSA from

http://www.users.zetnet.co.uk/zogginhell/download.html

Yes that's what I'm thinking guessing from it's larger size. It's notably
larger than PeST.

There's very subtle differences between the ST models, where most will recognise 250ms pulses and others 500ms. I think this is more to do with voltage drop more than anything else. 250ms obviously results in much more fluid mouse movement that 500ms, so the standard PeSTs are set at 390ms midway to take up most of the slack. There's the odd modified custom PeST out there which runs at 600ms.

In the beginning I swore that every ST keyboard sub system was the same, now with some experience behind me this isn't the case. Out of about 100 systems there's perhaps say 5 where the pulses PeST sends are misunderstood. Again, guessed to be voltage drop. Heavily modded STs with alot hooked up to the cartridge port, 16Mhz modded etc., can also have problems. You can have two STs both with the same mods, one will work and the other won't.

This guy if he starts selling these en-mass will become aware of this and will need the customer service skills (and time) to look after his buyers. PeST for example wasn't developed on one ST but a total of 5 different setups, 520STFM, 1040STF, 520STE, Mega STE (external keyboard), 520STFM (external TT keyboard). And despite that lot the odd system still pops up. PeST won't even talk to a particular Stacy I have in my inbox at the moment, mouse doesn't even initialise, works with all of his other STs though. That one's definitely summed up as a voltage drop issue as you can hook PeST straight up to 4.5v of AA batteries and it'll initialise (glows red) the mouse on it's own.

I entered this project thinking it was easy since the hardware was so standard, and then found out that 20 years after their release strange things are happening. Definitely an idea for PSUs to get their capacitors replaced in a few systems.

You need to find out if the designer is one and the same seller on
ebay. If not, then the seller is breaching copyright (assuming of
course he used this design).

Acknowledged. The readme.txt reads;

"All files, programs etc contained in this archive are copright 2004 by Tom
Kirk. Personal use is allowed but any commercial use is not allowed. Please
feel free to use my work but don't rip me off."

To some extent it was because of these disclaimers (and number of parts)
that we (Exxos & I) built PeST from scratch.

One of my spies had the following response from the seller;

"Hi
No.there are no parameters to be set up.It is as it says a ps2 mouse adapter
for the atari.If you want to speed it up then you put a mouse accelerator in
the auto folder or run the prg as you require"

Very helpful :)

I was just about to suggest weak PS until I read this last paragraph.

I know when I replaced the PS on the Mega ST that runs my BBS, several
things happened, floppy disk access sped up, the monitor display was very
noticably brighter, etc, etc,...

It's easy to forget sometimes, with Atari's as reliable as they are, that
we are running on approx. 20 year old hardware. :)

Some PSU's loose regulation and can actually rise in voltage also, this would upset some timings just as much as voltages sagging. Of course noisy lines will cause a whole bunch of other problems.. The ST is "clocking on a bit " :-)

Chris

Mulling it over this weekend, have been looking at case sizes available and what can be crammed into them.

I do have a true multisync monitor here... It's an NEC Multisync 3D and it does have the switch box with it I've mentioned up above. Plugs straight into the ST, with a toggle switch to go from mono to colour on the box. :) If you're anywhere near Bury (which from memory I don't think you are) then you're welcome to it. Not sure it'd be practical to post, say about £25 with Parcelforce 48.

Monitor case is also yellowed too, it's hygenically clean though as all of my systems go in a hot bath when I get them, and get cleaned with toothpaste. :-)))

Toothpaste everyone!! You have to strip the equipment right down and put it into 60oC water to soak until you can get your hands into the cooled down water.

I'm good, but not that good :) Aside from having a life too :)

http://profiles.yahoo.com/alyssa_yc2000

The Atari is just a nice hobby really as 99% of the people are cheerful
enthusiasts :)

An IDE setup could be devised for ACSI, I've done the IDE side. Just needs
more time put into it and getting answers to a few questions I don't have,
Uwe knows of me that's for sure. ;-)

Yes, flickering screen when the FDD accesses is a symptom of an iffy PSU.

How practical would it be for us to recondition ST PSUs? Is it worth writing up procedures? Which areas would need to be looked at? Is it just a case of the electrolytics drying up? We could source and sell a replacement caps set for the ST??

The caps dry ouy, voltage sag and causes ripple/voltage fluctuations. Its when the drive transistors start to go leaky that you loose the voltage regulation. You get all manner of nice faults, such as a 5V line when load with 1amp will rise to 5.1V, when loaded with 10amps, it can rise to 7V (talking general PSU's) Normally when loaded the voltage drops due to dry caps. Everyone already knows the rectifier dies sometimes taking out the choke with it. The ST PSU's are old. I do not think a "fix it kit" would be worth it, I sold on Ebay a box full of ST PSU's a while back for like a quid each... A lot of people can't solder so they wouldn't be able to do it themselves. I sometimes see ST's here which people send me for repair/updages though with the postage and services charges it doesn't always work out cost effective. I suppose you could offer replacement caps and transitors for them for a few quid, though do we really want people messing with stuff which plugs into the mains ? There are harcore fans out there which would send items to be repaired. Im sure theres a ST PSU repair guide out there somewhere already ?

Or a 1040STF with colour monitor, £899. Have the May 1986 copy of Personal Computer World which reviews it, was reading it yesterday.

20MB hard cards for £250. NEC V20 8086-compatiable CPUs for £100. 3.5" 720K FDD for £70.

Whatever happened to Silica Shop?

OK. How practical would it be to design a new PSU? As in the PCB, spec components to go on the board etc. It's noted that the ST PSU is actually a very old switch-mode PSU (I think) while the Amiga's is a solid lump of iron (transformer).

The power being kicked out by some of these modern day laptop PSUs puts the ST PSU to shame.

Best Electronics does sell a replacement PS. Its supposed to be better
than the original. Knowing Brad, I'm sure it is... Still a bit pricey
though.

It would probably be easier to just find a source for them, 5V,12V is as about as common as you could get. Would be best to ditch the old board and producing a mounting kit to fit a new type supply. Switchmodes are nasty bit of kit, probably a better idea to source a small transformer and use classic regulators for the job. I don't think you could design one and buy all the parts for less than you can buy one though. Apart from the rectifier blowing, then caps drying out, the ST supply has stood the test of time pretty well I think.

Bridge rectifier??

7025. Charley Image?

Newsgroup: comp.sys.atari.st
Date: 2006-06-04 14:16:31 UTC
From: Jim DeClercq <jimd@panix3.panix.com>
Message-ID: <e5upvvmlk1@reader1.panix.com>
Source record: 8152

Hard drives do not last forever, my backups are never quite current, and Google can no longer find Charley Image.

Does anyone have a working path, or a working copy I might have? It was freeware on the website of someone German who made neat accessories for Atari ST machines.

I think its W01 or soemthing like that, rated at 1amp, so you can imagine
the problems it causes. Actually I had a run in with them a while ago, They
get rather hot at 1amp at mains levels..

Dave Escott from TUS of Macclesfield designed and built some IDE
adapters for the ST, along with those pretty amazing Veloce+ cards
(68020 upgrade and fastram for STE). Shame he isn't around any more.

Also I remember Mario Becroft doing IDE interfaces which were sold in
the UK by Chris Crosskey of ASP. But sadly Mario dissapered without a
trace =(

Wish somebody could get hold of the old TUS designs and release some
more Veloce kits.

Keychange Music bought the TUS designs. He just needs 30 preorders to
restart production. It's a problem that it's STE only though, so I
guess the market isn't that big. There are many more STs out there
than STEs.

7033. HD partitioning problem

Newsgroup: comp.sys.atari.st
Date: 2006-06-05 07:16:35 UTC
From: Stephen Moss <sgm23@eng.cam.ac.uk>
Message-ID: <e60llf$ea4$1@gemini.csx.cam.ac.uk>
Source record: 8160

Hello all,
I have a System Solutions Mini S external SCSI HD connected to my 2.5Meg STfm via a Link 97 cable that I no longer require so I though the quickest way of erasing it would be to format it and then repartition using HD Drive V7.5. It formatted ok but I can't partition it, know I have repartitioned this drive before although I can't remember if I also reformatted it at that time.
When I try to partition the drive after clicking ok a pop up box briefly appears that mentions something about partitioning and the end of the second sentence is "memory..." but it is to quick to read it all. Am I being a complete idiot and doing something wrong or have I killed the HD by formatting it?
I also tried partitioning it with AHDI which complained that the HD was formatted with a previous version and requests that I reformat the drive, but when I try to do that with AHDI it refuses.

Thanks,
Stephen Moss

If the box you are mentioning is a regular popup displayed by HDDRUTIL
it should not vanish automatically, but only after having been confirmed
with a mouse click.
There is only one message (at least in the curent versions of HDDRUTIL)
ending with "memory", and it is displayed if there is not enough memory
left to operate.

> I also tried partitioning it with AHDI which complained that the HD was
> formatted with a previous version and requests that I reformat the drive,
> but when I try to do that with AHDI it refuses.

That's a known bug/feature of HDX.

By the way, can you please send me your HDDRIVER serial number? I cannot
find you in my database of registered users. Thank you.

Just need an ACSI one. Something simple, straightforward, small.

What puzzles me though is that so much time has been spent on developing kit with works (barely) with the cartridge port, GALS for internal IDE interfaces which need soldering in, yet no one has put the time into an interface that works straight out of the box.

The reason for this may be that it's not easy, as can speak from experience. IDE is easy enough as it's so well documented, SCSI a little harder. The ACSI stuff (almost SCSI) I need to reverse engineer with a logic analyser. Can't be arsed about sums it up here.

7036. The Nordic ATARI Computer Show 2006

Newsgroup: comp.sys.atari.st
Date: 2006-06-06 00:41:52 UTC
From: Mille Babic <mille@sverige.REMOVE.nu>
Message-ID: <kb4hg.3783$E02.1012@newsb.telia.net>
Source record: 8163

```
The Swedish ATARI Users Association (SAK)
The Nordic Atari Computer Show (NAS) 2006

Text version 2.0 (eng) 2006-06-02
------------------------------------------------------------------------

Updated information about the convention can be found at:
http://www.sak.nu/ E-mail: info@sak.nu

INFORMATION ABOUT NAS 2006
------------------------------------------------------------------------

THE NORDIC ATARI COMPUTER SHOW 2006
------------------------------------------------------------------------
```

Where: G�teborgs H�gre Samskola Gothenburg, Sweden.
Stampgatan 13. Same area as NAS 2003,2004,2005

```
When: 30th of June at 18:00 (GMT +01.00) to the 2nd of July 3, 15:00.
(Non-Stop)
For visitors without their own computers, the best time to visit
NAS is at Saturday 1st of July 10:00 to 19:00 and at Sunday 2nd
between 10:00 and 14:00.

What: A LAN-network with Internet connection is available for everyone.
There's
also a wireless network available if someone bring a laptop, PDA.
Static IP-Addresses to use, but there's also a dhcp scope in the
network.
```

Theme: ct60/EtherNat, FreeMiNT/XaAES
Seminars to be hold at 15:00-18:00 Saturday. At the moment
we do not have any seminars scheduled. Most users do demonstrate
their systems at
their tables.
Internet caf&#65533; with classical original ATARI computers, Falcon with
steinberg
software, sytheseizer, lots of ct60 some with EtherNat, Jaguars to
play
with.

```
Exhibition:
At this moment Nick Harlow (16/32-Systems) is positive and aimed
to come. We can all help him out before NAS with pre-orders and
also give him suggestions what to bring to Gothenburg.
```

http://www.1632systems.co.uk
http://www.1632-sales.zenwebhosting.com/acatalog/
nick AT 1632systems.co.uk

There's always ATARI users who sell things at NAS.

Entry: 30 SEK

Food? There's some restaurants close to NAS
microwave owen, coffe maker available. You have to bring your own
food.

Accomodation:

You can sleep at NAS. The building is a school, so you do have to
bring
all the necessary things to sleep on a floor. There's possible to
use
the showers as well. Gothenburg is a big town with hotels, youth
hostels.

Info: The latest info, maps is always to be found at http://www.sak.nu/

E-mail: info AT sak.nu (SAK)
mille AT sverige.nu (Mille Babic)
mrfuture AT comhem.se (Andreas Sj��)

Phone to: 0708-35 73 05 (Andreas Sj��)
0706-66 51 96 (Mille Babic)

KEEP THE TOS PLATFORM ALIVE.
WE ARE LOOKING FORWARD TO SEEING YOU AT THE NORDIC ATARI COMPUTER
SHOW 2006!

Best Regards

The Swedish ATARI Users Association

t> The IDE/CF side is already done. It's the ACSI/SCSI side I still (note
t> still) need to get round to, a bit of can't be arsed being evident.

Would you try to combine both, the ACSI-SCSI hostadapter and the IDE
"side"? Then there was only one adapter for both busses, probably less
expensive than producing two separate adapters with one being
prerequisite to the other.

t> It wouldn't really be possible to surpass the ICD host adapters, just
t> maintain compatability.

That is the central point anyway, essential so to speak.

t> A 40Mhz microcontroller yeilds about 10million cycles flat out, [...]
t> Moving onto the ultra fast TQFP package microcontrollers brings new
t> problems such as soldering the things and track layout.

Did you consider programmable logic? Probably the gate count was low
enough for using a CPLD, FPGAs still are quiet expensive...

Regards,

Alexander

I should have been more specific...

Is this your design /idea from scratch or is yours another public domain
solution put into production?

--

On the other hand I paid around £200 for my STE which at the time was less
than the price of a MIDI card for a PC....
Then there was the free SOZOBON "C" compiler and I could write midi programs
... Also no segmented memory model that really messed up programming PCs at
the time.

The reason for doing straight IDE is that if you emulate the Falcon hardware
later TOS will find and boot from it.
I think in the past many IDE drives did not report hardware config
(sectors/heads/tracks) so doing ASCI=>SCSI=>IDE was hard
original SCSI=> MFM adators needed a table of CHS for drive type....

Can you please send me an e-mail with a more detailed description
of the problem. I do not have MagiC-PC so I can not really test this,
but maybe I will be able to find the reason.

Actually yes, it is my design from scratch (and Exxos's). Every other one
out there needs numerous ancillary components and we gave up trying to
reverse engineer them into what we wanted.

How else do you think the thing is 14mm x 21mm?? :)

If you can get hold of one of the compettition and you find it is a copy of
yours then you can take some action, otherwise...

Yeah, yeah. Well I reckon he's just soldered the components together leg by
leg.

7055. Info on STE modem port

Newsgroup: comp.sys.atari.st
Date: 2006-06-08 01:05:30 UTC
From: phantomm <phantomm@bellsouth.net>
Message-ID: <tJKhg.14378$EX2.11932@bignews5.bellsouth.net>
Source record: 8182

I've had a 1040STe for some years, still in new condition.

I would like to change the modem port to a 9 pin like on the
MSTE/TT/Falcon.

Can I use a simple adapter to reduce it down to 9pins or will
I need to do some re-wiring?

phantomm@bellsouth.net

7056. Encryption on Ataris

Newsgroup: comp.sys.atari.st
Date: 2006-06-08 01:14:55 UTC
From: phantomm <phantomm@bellsouth.net>
Message-ID: <iSKhg.14379$EX2.13720@bignews5.bellsouth.net>
Source record: 8184

Years ago I recall a discussion on this subject.

Without doing any research first, thought I would ask in here.

Is it illegal to send e-mail or do a posting with the text content encrypted?

As there are programs for the Ataris that will encrypt files.

With all types of hacking and such that goes on, I would like to keep some of my e-mail as private as possible.

phantomm@bellsouth.net

AFAIK not any *meaningful* encryption. I.E nothing that won't be easily
breakable.

> > > With all types of hacking and such that goes on, I would like to keep

The question isn't "am I paranoid?"

The question is "am I paranoid enough?"

Regards,
David Bolt

AFAIK it is very illegal e.g. in the United States (a state that has brought the BigBrother-type oppression to heights never dreamt of by China and such).

I remember that some years ago there was a silly situation about the PrettyGoodPrivacy encryption program. A new release of this program introduced an improved encryption algorithm which, at that time, the US government agencies could not break into. So, that new release of PgP was proclaimed illegal in the US. The rest of the world, of course, ignored such nonsense, and so newer versions of PgP were 'legal' only outside US.

It seems that the rest of the western world is catching up with this nonsense unimaginable, though. Briefly: if an encryption program is any good at all, it is, or soon will become, illegal in more countries.

On the other hand all this is a minor matter in a world that has suddenly found it quite acceptable to keep certain people jailed for years without any court sentences, or even without any charges raised...

Somewhat more off topic: a bleak future is not only for encryption programs. From what I have seen, it may soon become illegal for an individual even to write any software (and the new machines may refuse to run it, see www.againsttcpa.com), if he is not approved by the allmighty government and multinational companies. E.g. there was a comment on www.videolan.org (home page of a nice freeware multiplatform vultimedia-player software): according to upcoming French laws, it may become punishable by a jail sentence even to publicly discuss algorithms for reading/playing some video media.

Very Interesting....

The last discussion I recall on the topic of encryption in here, most said that
it was illegal in the US to use encryption for e-mail.
That was some years ago.

I can see that most folks would not want to find a posting that is encrypted in
a news group, unless the newsgroup deals with encryption or similar.
Maybe if everyone in the newsgroup had the key to read the message it would be more welcome. ;)

I would think that some type of encryption is used on Web Sites that allow access
to private info, such as Banks and etc. I'm not positive on that. But there is some
type of software security I would think.

I just don't want to break any federal law for sending a encrypted e-mail to a friend
of mine using an Atari. Not that I would be sending any info that's illegal.

I do enjoy computers, but we sure have lost alot of privacy and etc with the mass use
of them.

Not that I know of in along time.

But years ago, when I was using Oasis, someone while I was online was
able to create a directory on my hard drive that was read only. And I could
not delete no matter what I tried. (Never tried Formatting) Guess that may
have
worked.

Also, while using Oasis to get news groups, I got several text messages that
appeared on the screen. Really Wierd. One said to" E-mail us here Now!"
with no address. And some other stuff.

This happened a few times, then never again.

7076. TOS v. 4.02

Newsgroup: comp.sys.atari.st
Date: 2006-06-09 22:21:08 UTC
From: phantomm <phantomm@bellsouth.net>
Message-ID: <mvmig.8459$ED2.8004@bignews2.bellsouth.net>
Source record: 8203

I have a fairly modified Falcon that has TOS 4.2.

All my other Falcons have TOS 4.04, and I have a spare TOS 4.04 that
I could swap into the TOS 4.2 one.

I was wondering what the differences are from TOS 4.2 to TOS 4.4?

Is there a Text file with the fixes and or enhancements?

Also, before TOS 4.04 was released, were there any program fixes
especially for TOS 4.02, that would be useless on TOS 4.04?

For what I remember with Tos 4.02 there is no end of partition check, so on the good old 45 megs IDE drives that were formated by default with 3 or 4 partitions, you could just fucked up one of the partitions by adding too many things in the previous partition.

Tos 4.04 probably fixed more things, but I don't remember exactly.

With Tos 4.01 vs 4.02 it's easier to notice the difference, the 4.01 is buggy, and has an incomplete "3d look" that makes applications look very strange.

I am trying to determine if I should swap, with this very bad bug, I think
I'll do
so asap!

Also guys, what type of chip is TOS 4.01 to TOS 4.04 on?
I mean, whats the official name of the chip?

I have a Chip Burner and what to know if I can use these type of chips
on it or not.

Thanks,

Here I use the PARCP parallel cable. Documented here;
http://joy.sophics.cz/parcp/ Not really networking in the traditional sense
but good for safely getting data back and forth. Quite fast too, about
50KB/s on a bad day.

Trouble is with PARCP is that everything has to be transferred explicitly,
it's more like a data transfer application. But quite reliable and stable.

I think the problem of end of partition going on the next is on TOS 4.01,
not 4.02.

The difference betwwen 4.02 & 4.04 is that TOS 4.04 do not more need the
FOLDER.PRG in the AUTO.
And a XBIOS function about RS-232 port on Zilog was modified / corrected.

I do not remember the rest... if there is...

TOS 4.02 have a sound bug. You need FPATCH.PRG and FPATCH2.PRG to
correct it for a single TOS only, not with MagiC/MiNT because
MagiC/MiNT correct this bug.

See you,

Cyril.

I'm pleased that xaaes.atari.org is back again, as some other
sites hosted similarly. That was worrying because this is
critical and a key site in the evolution of the ATARI scene.

Thanks for your work.

Best regards,

We're offering all the latest factory pressed high quality dvd movies,
ps2, psp and xbox silvers with factory printed colour inserts at
fantastic prices, whether for personal use or reselling. We're shipping
worldwide with various shipping methods. For resellers, please contact
us for bulk discounts.

For a complete list and prices, please email us at
spikes@spankthedonkey.com

(Please state the type of list that you want and tell us your location
as the prices varies for different locations. If you're reseller,
please state the quantity you wish to order per shipment and we'll
quote you a wholesale price depending on the quantity ordered.)

* If you need references, we can provide them to you.

7095. Cryptographer

Newsgroup: comp.sys.atari.st
Date: 2006-06-11 18:22:03 UTC
From: Ed <lener@vt.edu>
Message-ID: <e6hn12doh1@solaris.cc.vt.edu>
Source record: 8222

Some of the recent postings about encryption reminded me of an old program for the Atari ST called The Cryptographer from Fair Dinkum Technologies. This was not a tool for serious protection in any way but rather was just for fun generating simple cryptograms and decoding messages and the like. Anybody still have a copy of this or know where it might be available for download or purchase?

Another network solution is always welcome in the Atari world.

Can someone list the advantages over say, the EtherNEC?

Thanks.

>there is some type of software security I would think.

Of course there is. But, AFAIK, the only type of security that is permitted
is the one which certain government agencies can break when they think it
suits their interests.

>I do enjoy computers, but we sure have lost alot of privacy and etc with the
>mass use of them.

Computers are certainly not to blame for the loss of privacy. It is the
government(s), or the powers that stand behind them, who first create all
sorts of crises around the world, and then, when the world strikes back,
provoke paranoical fear of 'enemies', 'dissidents', 'terrorists', etc.
as an excuse to assign themselves the rights to press on their own people,
but certainly not in the best interest of the people.

A request to keep e-mail unencrypted leaves a very bad taste in the mouth.
Basically, what stands behind that request is that they want you to make it
easier for the police to spy on you. There is really no difference between
that and a (hypothetical ?) obligation to submit all your (paper) mail
in an open envelope to a police station before sending it, or to leave
the doors of your home unlocked and open at all times so that the police
would not be bothered with unnecessay paperwork when they want to inspect.

(By 'police' I meant generally FBI/CIA/NSA/MI5/KGB/Holy Inquisition/whatever...)

Some people do not realize it yet, but the darker pages of Kafka or Orwell have
become so very true...

But this thread is sliding off topic (i.e. atari computers). Maybe I should not
have replied to it, but I was provoked by a biased post which implied that
China is an opressive, nondemocratic country, as opposed to (a paradise in)
the rest of the world. China surely is nondemocratic and totalitarian- about
as much as the US, or Britain, or..., only in a slightly different way.

First off, make sure the Falcon has a defaultroute set to the router. Then
make
sure the Falcon can resolve DNS names via the router or via your ISP's
DNS servers.

That should be it.

If you look at your WinXP box and type 'ipconfig /all' you'll get the
details from that
that you need to put onto the Falcon.

Alan.

Hi Djordje!

Can something compare to a solid ATARI screen (ANTIC preferably)?

No. Only when changing the TV-channel from AV to the Football World Championship channel (ARD, ZDF, RTL). ...when will the Computer make such pictures... :-)

Best Regards,

Daniel Mandic

Hi Ronald!

RJH> Can someone list the advantages over say, the EtherNEC?

- small PCB
- no need for additional ISA networking card
- USB for all Ataris (though probably quiet slow on 8 MHz ones)

I think that's quiet a lot of advantages ;-)

Regards,

Alexander

Theres always a problem introducing some new hardware. No one buys it because there is no software written, and no software is written because no one has the hardware.

The idea is, having network and USB intergrated on the same board it'll be handy for network primarily and with x amount of people having USB hardware to play with, hopefully some software will come about. I'm hoping this will also get Jan Thomas interestted in writing USB software once again.

I should be updating my website soon, new re-design and some info on a new project.

Lyndon

There are different models for Falcon
- Some are capable of auto adaptatation from 100 to 240 V...
- Some are not able of that and you have to verify it.

7109. ICD Link && 2GB HDDs

Newsgroup: comp.sys.atari.st
Date: 2006-06-13 09:11:29 UTC
From: techie_alison <retro@dial.pipex.com>
Message-ID: <FrSdnTX3SpoR4hPZnZ2dnUVZ8qSdnZ2d@bt.com>
Source record: 8236

Hi,

Bit of trouble here and not sure what I'm doing..

1. ICD The Link (believed to be the L1, no led, grey)
2. Seagate ST32155N
3. IBM DORS-32160
4. Cumana SCSI1 enclosure with Matsui CD ROM
5. HDDRIVER 8.1 Demo
6. Centronics-50 terminator
7. Atari 4160STE TOS 1.6
8. ACSI extension cable

OK. HDDRIVER will recongnise the Cumana CD ROM on it's own, no problems, varying IDs, it sees it.

If I substitute the drives (2 && 3) then I don't see anything. Parity disabled. Now occasionally on the IBM when it's first plugged in HDDRIVER will just identify a bus number relating to the drive, and then it won't see it again.

I've tried lots of different combinations, plugging in the terminator, different IDs, TERM ON. And I'm getting no where. I can hot swap the CD ROM back in and it sees it. Have tried cold starts. You know how it is when you're trying everything.....

Any ideas?

Thanks kindly,

Alison

Even though you said you are sure that this is not a termination issue
the problem you have is typical for wrong termination, bad cables or
cables that are too long.
Your IBM drive is the one with 1 GB, isn't it? I once had such a drive
myself it it was very important to get anything right on the hardware
level. Otherwise strange things happened, like the drive sometimes just
not responding anymore etc.

I have a pile of drives here, sometimes they will list sometimes not,
sometimes I can partition them, then the drive will vanish again. They all
work perfectly on my Falcon but do not work on the ST. The only
explinations are the drive is loading the cable somehow and its bordering on
logic levels, or the link does not understand what the drive is. Use a older
drive, I have a pile of seagate, they do not work. There are some other
drives but do not work. I think its becasue its not really SCSI, its that

RLL? interface.

Hi Uwe, thanks for replying,

The IBM drive... just checking. 2160MB

Options I have are;
JP1 - SPARE (50PIN) ID BIT 3 (FOR WIDE)
JP2 - ID BIT 2
JP3 - ID BIT 1
JP4 - ID BIT 0
JP5 - DISABLE AUTO SPIN
JP6 - SCSI TERM ON
JP7 - DISABLE UNIT ATTN
JP8 - SPARE
JP9 - AUTO START DELAY
JP10 - DELAY START 6/12
JP11 - DISABLE PARITY
JP12 - LED OUT

To be honest it's as if it doesn't communicate with the drive at all. With
the CD Rom it reports back model etc. With the IBM it reports that there's
something on the bus, say 0:1 for example and that's it.

First attempt I tried the following set;
JP3 - ID BIT 1
JP6 - SCSI TERM ON
JP11 - DISABLE PARITY

I've also tried it with JP6 clear.

Could it just be incompatiable drives or would you expect them to be
recognised?

Oh it's this one on the right by the way;

AFAIK, all secure sites use encryption.

In the UK, encryption is not illegal (yet!) but it is an offence not
to provide police etc. with the key if asked for - there has to be a
legally valid reason for this, probably a warrant. The law is targeted
on terrorists and paedophiles whose computer(s) may be sesized in a
raid. As an article in /The Times/ this Monday pointed out, as the
penalty for not providing the key is lower than that for being caught
with child pornography (2 and 10 years max respectively), many paedos
won't divulge the key to cop a shorter sentence. The Governments
proposal is to increase the max sentence for failing to provide the key.

Getting back to the original question, there is a version of PGP
available for the Atari, which is pretty secure. The last version
was 262I, I believe. It comes with some interesting DOCs about the
problems the authors had in the US...

Regards, /Peter/

I used these on my old BBDP interface before I sent them to Alison. I think
they both 2 gig. They partitioned up fine with HD Driver 8.1 but as its an
old interface I could see 1 gig. I just set termination on the drives, and
did not use external termination. Now Alison has an ICD should she see 2
gigs. Will this confuse HD Driver?

Hi Dave :-)

I'm currently going through the comp.sys.atari.st archive on Google Groups at the moment and am finding out loads. The Seagate I have working in that it's recognised fully by HDD, it isn't sure if it wants to power up though. The IBM is still saying no.

At the moment I'm suspecting my enclosure is iffy or underpowered, it's only got a little transformer in it which was driving a CD-ROM.

Not hugely desperate to do this asap so no rush here :)

It's really making me want to dive back into the CF project again as I don't think I could bear the sound of another HD running. The beauty of the ST is that the only way you know it's on is from that LED on the bottom left of the keyboard :)

That sounds plausible.... You might want to check the drive specs. The PSU I use was bought at a Radio Rally about the time I bought the BBDP interface. It gets very hot but it seesm to deliver the amps. I have two the same. One runs the HDD iunterface and drive in one box. The other runs a 3.5 and 5.25 "floppy" drive enclosure. Don't laugh folks , at one time, when I had a M6809 system I had 5" drives....

At another Radio Rally (This weekend) I saw IDE to CF for £10.00. I almost bought one for my STE which at present has an IDEAL interface and 2.5" drive so I think it could be fitted in niceley. I wonder if you could do SCSI => IDE => CF using one of these =>

http://www.span.com/catalog/product_info.php?products_id=1059

They are a bit on the expensive side, but if it worked you could have nice, low power CF STs, TTs or MEGAS...

Er, really dumb question, but you're not using -both- are you? :)

Just making sure...

Also, lemme try to roughly sketch out how my setup works on my Mega ST
(the system that runs my BBS):

Mega ST -> ICD Link2 -> EZ135 -> 4 gig Seagate HD -> Plextor CDRW -> TERM.
ASCI ID1 ID3 ID2 ID4

The hard drive and CDRW sit in a 2 bay enclosure with their own P/S.

I used to use the EZ135 (carts) for backup, but since CDs work so well on
Atari's with ExtenDOS, I just keep it in the chain now, to power the Link.
For some odd reason, the Link doesn't get the power it needs from the 2
bay case alone.

No, this does not matter. The second GB is simply not accessible if
there is no partition on it, but this is no problem.

7122. For sale: Atari books and programming software

Newsgroup: comp.sys.atari.st
Date: 2006-06-14 06:20:11 UTC
From: Mike <no@spam.com>
Message-ID: <vUNjg.4739$E02.1508@newsb.telia.net>
Source record: 8099
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

For sale:

The Atari Compendium - books, volume 1 and 2 (as new, excellent condition).
+ a book on AES (can't remember the name of the book, I'll look it up today).
$25 + freight for all of them (3 books).

HiSoft C Interpreter - software, including a big manual/book and disk.
$25 + freight.

Lattice C - software, including 3 comprehensive books (programming manuals/references)
and disks.
$25 + freight.

Or buy everything for $50 + freight.

Freight cost depends on where you're located. The books are quite big and heavy, especially the Atari compendium, so the freight cost will probably end up around $25 (I'm guessing, will check in detail).

Please email atari@mhc.se for more information.

Kind regards
Mikael

RJH> For some odd reason, the Link doesn't get the power it needs from the
RJH> 2 bay case alone.

The Link(2) needs power from the SCSI bus pin 38 (TRMPWR - terminator power). Though any SCSI device should feed this line many don't. In a SCSI case the SCSI cables usually are provided but not "touched" (i.e. no additional connections are made).

When I bought my first Link2 I did not know about this and sent it back thinking it was damaged, for the SCSI-HD was working perfectly on my TT but not on the ST/Link2. I was charged for the functional test ("fully functional") and advised to ensure supply of TRMPWR. So I did it manually (wire, diode, soldered to the Link2)...

I recently changed the IDE drive on my Falcon, and I've noticed that it has difficulty booting from the IDE drive. I've put an original Atari IDE drive (64MB!) in to the Falcon and still get the problem. It boots fine if I put a disk in the floppy drive with a AHDI on. The Falcon boots AHDI, finds the hard disk and will even get the desktop config files, etc.

The HD is properly installed on the 'C:\' drive, etc.

Any idea what's happening. This particular Falcon has a fading NVRAM chip so not sure if that is the problem?

Cheers

Ian.

That should be AHDI is properly installed on C:\ drive.

Intrestingly after a few cold boots it works fine (ie boots without
the FD) - but if I leave it a day or so I get the same problem.

That is wrong. The SCSI standard only requires the host adapter to supply
TERMPWR, which is the Link in this case. Other devices *may* provide
TERMPWR, but are not required to do so by the standard.

Many devices have a jumper, and most have the diode and fuse required by the
standard, so if the TERMPWR line has been shorted once in the past, it may
well be that the fuse is open, so it is best to measure the voltage on the
TERMPWR pin on the bus to be sure.

Yes, the IBM is as follows;
3. ID BIT 1
6. SCSI TERM ON
11. DISABLE PARITY

The Seagate is set as;
1. TP TO BUS
4. PARITY DISABLE
8. TERM ENABLE

The Seagate I've had the most success with so far. I'm tempted to pull the
ST157A out of the MSTE back home so that I can establish a control baseline

for comparison.

Uwe, are you ok with a PayPal payment and emailing HDD over? The inability to be able to format and partition is preventing me from going further and it's such a well written bit of software.

You sure its not stiction? Or something like that with the hard drive.

After all, if its one of the first 2.5" drives that came with the original Falcons, its getting a bit old, isn't it? (13-14 years).

I remember an old Megafile 60 that I had on my BBS for awhile. It was fine as long as it was running - turn it off, cooled down, it didn't want to start back either...

Just a thought.

7133. For sale: software (Cubase Audio, NVDI 4, Extendos Pro etc).

Newsgroup: comp.sys.atari.st
Date: 2006-06-14 13:53:35 UTC
From: Mike <no@spam.com>
Message-ID: <zxUjg.4774$E02.1495@newsb.telia.net>
Source record: 8110
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I sell the following software for Atari:

--> Cubase Audio Falcon - including dongle, floppies, manuals and box.
Everything original in good shape.
$75

--> Interface (pro resource editor)
$10

--> NVDI 4
$10

--> Extendos Pro
$10

--> HD-Driver
$10

--> Dig-It (a sampler/tracker for Falcon 030 and STe)
$10

--> Nevada Cobol for the Atari, including a comprehensive manual.
And a big book on the Cobol programming language, which I bought
separately. I have a picture of these which I took with my mobile camera.
I can email it to you.
$25

Add freight from Sweden to the price. The freight cost depends on where
you're located and how many items you buy. If you buy more than one item
then I'll give you a discount, no problem.

Please email atari@mhc.se for more information. Don't forget to tell me
where you're located, so I can calculate the freight cost.

Kind regards
Mikael

Just follow the appropriate PayPal link on
http://www.seimet.de/hddriver_english.html. As soon as I have received
the payment I will email you the software. The English manual and the
driver floppy disk will arrive by snailmail.
Please keep in mind that the full version will not solve the (most
likely hardware-related) problem with your drives addressed by this tread.

Actually, I was guessing that by the time the floppy got accessed, read, then found its way to the HD, that maybe the HD had enough time to "catch up".

With the built in mem check and HD delay built into that TOS version, what happens if you wait for the black bar to go down by itself and not hit space to speed it up? I'd be curious if that would give the drive time enough to come up to speed, so to speak.

I did it too, but I kept the standard jacks on the back. I found that I
had a light left bias, but I didn't care too much as I obtained a
FDI/FA8 setup, which was so much better.

Coda.

That's what it sounds like. :) I can tell you this though, if it isn't set
then the drive doesn't get recognised. The other two combinations were
tried too.

7142. FALCON to FIX

Newsgroup: comp.sys.atari.st
Date: 2006-06-15 00:48:41 UTC
From: phantomm <phantomm@bellsouth.net>
Message-ID: <o42kg.88757$iB2.53738@bignews4.bellsouth.net>
Source record: 8119

Greetings,

I have an Atari Falcon, that has a problem and would
like to fix it if possible, instead of using it for parts.

It is an original Atari Falcon 030 with stock 4megs and
Conner 84 meg IDE hard drive.

This Falcon looks New inside and out. Really Nice.

There has been no modifications what so ever and in fact,
I don't think anyone else has had the case opened besides
myself.

It still has the factory speaker and copper shield on the left side
of the Conner IDE. No FPU, and a Jumper on the expansion port.

I do know that the power supply is good.

Now upon booting this is what happens.....

Green Power Led comes on as does the FAN, I get 1 Blink of the
Yellow Hard Drive Led on the Keyboard, the hard drive starts a faint
Clicking noise. (I'm not sure if this is the normal sound of these older
Conner IDEs or not, I do have 2-3 of them.)

The internal disk drive does not flash its LED and appears dead.
I get nothing on the Monitor screen. (Black).

The system reset button doesn't seem to work.

I inserted a blank disk in the drive and cold boot from the power switch,
Same thing, the disk drives Led does not flash and the drive appears dead,
no disk access.

I have looked fairly close at the motherboard and see no problems.
No High Heat marks or etc. Motherboard is clean as can be.

There has been no clock modification.
R216 is a surface resistor
R222 - surface resistor
R221- has solder instead of a resistor.
R217 - Brown resistor with 1 Black band.
R234 is a surface resistor.

There are no Piggy Back chip(s) on U63 or anywhere else.

TOS Chip is labled with a silver label as..
1992 Atari Corp TOS 4.01.

Someone has taken a Red Marker and placed a 4 over
the 1 in TOS 4.01, so I think it is TOS 4.04.
(I think this was done at the Factory)

I am not sure what is wrong with this Falcon, It appears New
inside and out. Best Looking Stock Falcon that I have.

I was thinking that the NVRAM maybe bad, if so would it cause
the disk drive to appear dead?

The disk drive is accessed normally before the hard drive,
if I remember correctly. But this is not happening.

I have a Falcon motherboard for parts, if I knew for sure
what was wrong. I could swap the NVRAM if it sounds like
this could be the problem. If its a surface mounted chip thats
bad, then I would probably send it to someone to fix for me.

Could a bad disk drive cause problems with the display?

I have swapped PowerSupplies, so I know its good.

Also, I am not sure if the Hard Drive is setup correctly or not.
I've not swapped it out to check it. But it does not seem to be
loading anything. I only get 1 Blink from the Yellow hard drive
Led, and the drive starts up. It does seem to be a bit noisy (clicking).

I do have extra parts and etc to swap out as well as other
Falcons that work fine.

Where should I look or go from here?

Any help is much appreciated, I would really hate to
turn this one into a parts machine.

I would definitely try swapping the TOS. It sounds like even the most
basic TOS initializations are not being completed. It actually sounds
pretty bad :(Even if it's clean, it could easily have been hit with a
power surge or spike.

Thanks,
Mark

Hi,

First try to remove both the HDD and the Floppy drive. The system
should boot this way also. If not, try to reset the NVRAM (there is a
key combination for this, I don't remember what).
Are you sure, that your monitor cable is OK?

Regards,
Jozsi

From the "sound" of it this does seem to be the source of the problem,
good call.

The Connor drive was original fitment, and it's now very old.

If the hard drive clicks more than a couple of times it may not be spinning
up properley. Don't know about Falcons but on PCs if the IDE hard drive does
not spin up the machine stays dead.

I would start by swapping the hard drive out, and seeing if the machine
boots without it. If that does not change things then minimum memory and
also re-seat any socketed chips.

Did you setup the HighWire network.ovl? Rename the OVL for your
prefered IP-stack(stik, iconnect) to network.ovl in the modules
directory. There is also a readme.txt in the same location.

If it is old and for ST, it might be "Psion Chess".

I know Chessmaster or Chessmaster 2000. Something like that. When it
started, it said:
"I am the Chessmaster, wanna play a game?"

Was it that one?

Cheers, Ingo =;->

It didn't run in a high-res screen, but I was always partial to
BattleChess. Loved the animations... :)

7158. For sale: Reduced prices on books and software

Newsgroup: comp.sys.atari.st
Date: 2006-06-16 15:25:41 UTC
From: Mike <no@spam.com>
Message-ID: <V3Akg.5007$E02.1689@newsb.telia.net>
Source record: 8135

Hard to sell these items, so I lower the prices.

The Atari Compendium - books, volume 1 and 2 (as new, excellent condition).
+ a book on AES (can't remember the name of the book, I'll look it up today).
$15

Lattice C - software, including 3 comprehensive books (programming manuals/references)
and disks.
$15

Nevada Cobol for the Atari, including a comprehensive manual.
And a big book on the Cobol programming language, which I bought
separately. I have a picture of these which I took with my mobile camera.
I can email it to you.
$15

Interface (pro resource editor) +
NVDI 4 with printed manual +
Extendos Pro with printed manual +
HD-Driver with printed manual
$15 for all of them.

Or buy everything for ... well give me an offer and I'll consider it.

Add freight from Sweden to the price. The freight cost depends on where
you're located and how many items you buy.

Please email atari@mhc.se for more information. Don't forget to tell me
where you're located, so I can calculate the freight cost.

Kind regards
Mikael

Hi denbler!

Try Colossus Chess 4.0. I think the ST Version was called Colossus Chess X. I have only found this article, pointing out some troubles with the Program.

http://www.stcarchiv.de/am89/05_colossus.php

Yes, I renamed the network.ovl to sting.ovl and still I get the same error
message. I originally posted that I have NVDI 3.0, what I really have is
NVDI 4.11.

Hello;

I use an IBM drive (DSAS3540) and had problems with it (could not be
recognized and booted from unless reset at exactly the right moment,
until I set the following option:

>JP7 - DISABLE UNIT ATTN

I vaguely remember that this setting was from some text that I found
somewhere, and it explained that if "unit attention" is enabled, the
drive sends at powerup more data than TOS expects at that moment, and
proper communication can no be established. IIRC different TOS versions
were supposed to behave differently in this matter, I tink that TOS 2.06
was a division.

>JP6 - SCSI TERM ON

This should be set only if this drive is physically at the end of the
cable and you do not use other terminator.

cu;

Yes I also have the PARCP cable/software and it does work great. 100,000 bytes
a sec transfer rate. The software works best under regular TOS.

What are you using to connect to the internet (STik, STING,etc)? You need to go into the Modules folder and pick the OVL file that pertains to you. Then rename it "network.ovl".

From this it looks like you have termination set on for both (6.
and 8. respectively) - not a good idea! Only terminate the far end!

Are you sure the termpower from the Seagate is looped through? Try
reversing the physical order of the drives.

I know it shouldn't make any difference, but I find that with the
CD-ROM, EZ-135 and HP tape chain on my Falcon, it sometimes
matters which order they are connected in; in one combination
(can't recall which) one of the drives isn't seen for some reason.

Thanks, I rename sting.ovl to network.ovl and now I can get to google, but
when I try to access the atari-users web site it never loads from highwire,
I can see the message "receiving from atari-user" then "sending to
atari-user", but Atari-Users page never loads. Any suggestions. I am using
the latest version of Highwire.

7176. CD Writer Suite 4 backs up Mint paritions

Newsgroup: comp.sys.atari.st
Date: 2006-06-18 08:15:58 UTC
From: "Edward S. Baiz Jr." <edbaizjr@comcast.net>
Message-ID: <449535f211f440@comcast.net>
Source record: 8056

Hello,

CD Writer Suite version 4 is out from Anodyne. It works great and now supports DVD players/writers. It can even backup a Mint partition. However, only the Restore option works in CDBackup not the File Restore. You also cannot bring up the contents of the backup using the Session.CPX file. You can backup the partition and use the Restore option to re-write all the files to a partition. I was able to do this on freshly formatted 2 gig Jaz cart. I used OSMD to format the cart in an EXT2 format.

Why not use DYNDNS to get a free DNS entry.
what terminal set up do I need. It just says

Press <ASCII> RETURN...

Just hit <enter> or <return> a couple of times, and the BBS software will
start right up.

Command line/shell, Hyperterminal, console, eterm, Telnet-ST, all of these
work fine that I have tried...

I'm looking for something like Cardfile. As a Desk Accessory that doesnt load it's whole file into memory or run out of memory but accesses it's files from the hard drive. And prints to my HP Laserjet 6L onto 3x5 index cards. ===Ben===

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/ Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

7183. Re: Falcon IDE boot

Newsgroup: comp.sys.atari.st
Date: 2006-06-20 09:25:40 UTC
From: cii-2d21@iximail.com
Message-ID: <1150795540.351461.26750@r2g2000cwb.googlegroups.com>
Source record: 8060

The problem turned out to be the NVRAM chip. I replaced it and
everything worked fine even after leaving the Falcon for a few days and
rebooting, the IDE drive comes up straight away. Before it was very hit
and miss.

The clock also works now which is a bonus :-)

Ian.

Thanks everyone for the help.

I will be swapping out the hard drive and etc. to see If I can get it going.
Will post the results.

What gets me is the disk drive not working, but power getting to the hard
drive,
even though the hard drive may not be spinning up completely.

7185. Atari ST-Falcon Items to sell/trade

Newsgroup: comp.sys.atari.st
Date: 2006-06-20 21:15:30 UTC
From: phantomm <phantomm@bellsouth.net>
Message-ID: <MzZlg.70533$qd2.3882@bignews6.bellsouth.net>
Source record: 8062

Folks I've been going through my Atari Storage and have some extra
items that I had planned to put up on E-Bay. Some I have more than one,
others I have only 1.

I don't have a list ready yet.

So If anyone in US/Canada and maybe overseas is looking for a special
piece of original software or hardware for the Atari ST/STE/MegaST/
MegaSTE and or Atari Falcon 030. Then do contact me thru
e-mail as I may have the item.

If you tell me what you are looking for, I will search thru my many boxes of
Atari items for it before I go to E-Bay with it.

I also have some Brand new Cables, such as SCSI, Centronics and etc.
If ya need a good cable or two, let me know what type ya need.

Also have misc. parts and things like memory boards for the Falcon.
And many good Books and Mags.

Thanks,
phantomm@bellsouth.net

If you do #3, please make sure you support arbitration (like the
Link96/97). Arbitration is *required* since ye olde days of SCSI-2, and
much current hardware won't work with the ICD Link 1/2 adapters because
of that.

As far as #4 is concerned, what I'd *really* like to see is an IDE
adapter for the TT. It can be soldered to the MB as far as I'm
concerned, no need for an external-only box.

But alas, I doubt the demand is there ...

Roger

Is that IDE to SCSI or SCSI to IDE ;-)

I use my TT with an adapter. I have a 10GB IDE HD on the internal SCSI bus. Alas I cannot fit the drive with adapter into the case without some modification, but it works great, and its quick.

The adapter is made by Yamaha, was intended for those people moving to Yamaha's IDE CDROM drives but still had scsi adapter cards. I bought mine for a couple of euros off evilbay.

Coda.

I could use one.

I have 2 spare TT's. I must have done some stupid thing with
wrong termination. I managed to get both SCSI chips dead.
Both surfuce mounted :-(

I would like the memory of that day wiped out of my mind.
When I tried connecting with another set up, I happened to
do it on the still good TT by accident.
All TT's look the same.

Hello Henk!

HR> I must have done some stupid thing with wrong termination. I managed
HR> to get both SCSI chips dead. Both surfuce mounted :-(

Sad thing, but guess what happened to me with my first TT - exactly the
same. But I assume that it was no matter of termination but unstable
external wiring that lost contact while power was turned on.

HR> When I tried connecting with another set up, I happened to
HR> do it on the still good TT by accident.

Ouch!

Did you think about replacing the SCSI chips? That's what I did - cut the
pins of the damaged chip, unsolder them separately, solder a SMD socket
and plug in the new chip... took me almost one day. I had to use a flying
wire to replace a copper pad of the PCB by flying wire as I accidently
removed it with the pin...

The TT still works flawlessly with SCSI devices!

If I remember correctly the material cost (SCSI chip plus socket) was
below 30 Euro. Just checked BEST electronics prices: 15$ for the L5380
(used in the TT), 20$ for the L53C80 (used in the Falcon) - not sure about
the differences.

If you can't do that yourself or have no friend to help you out feel free
to contact me!

Regards,

Alexander

7201. TT030 and Daynaport troubles.

Newsgroup: comp.sys.atari.st
Date: 2006-06-25 01:00:57 UTC
From: Claude Bourgoin <claudeab1@adelphia.net>
Message-ID: <E_GdnWDdPc_-fQDZnZ2dnUVZ_uidnZ2d@adelphia.com>
Source record: 8078

I have a TT030 connected to my home network with a daynaport. The problem is everytime I turn on the TT with the daynaport connected the TT030 crashes after it loads one of .stx files.
In my auto folder I have Sting.prg, SCSIlink.prg and have only the 3 sting network .cpx.

HDDriver sees the daynaport because it tells me that Daynoport rom is ver 2.0F. I have ten megs of ram in the TT. I am only using TOS as the operating system.

This same daynaport works fine on my Falcon running Magic 5.11.
Any suggestions will be greatly appreciated.
Claude Bourgoin

Claude,
There was a problem at one time with HD Driver V8 and Daynaport and you don't say which versions you are using. If you have HDX V8.xx you need v0.71 of the Daynaport box. In any case it might be worth trying V7.xx of HD Driver...
Dave.

I doubt that this is a HDDRIVER issue, otherwise I would expect problems
with the Falcon, too. You should check your resident programs, AUTO
folder and accessories.
By the way, I cannot find you in my database of registered users. Can
you please send me the serial number of your HDDRIVER? Thank you.

7204. Aranym -(easy)Mint-gcc/gdb

Newsgroup: comp.sys.atari.st
Date: 2006-06-26 08:23:46 UTC
From: Luc <lajmve@yahoo.com>
Message-ID: <1151310221.333451.216150@u72g2000cwu.googlegroups.com>
Source record: 8081

Hi,

I need help in having a development environment up and running under
aranym for atari-st.

Long time ago, I was a Mega-4 owner but does not have access to the
hardware and various software tools anymore.

For a project, I have to re-compile and debug a program written for
ST... it will be re-engineered and deployed potentially under linux.

Therefor, I need access to gcc, gas, ld and gdb for starters (parts are
written in assembly).

I have the emulator Aranym-0.9.0 running and nicely booted. I was
planning to put easymint on it as described in
http://arnaud.bercegeay.free.fr/ezaramint/

But run into problems during the installation. It is identical as
described by Jeff
http://www.google.com/search?hl=en&lr=&q=jeff+mitchell+atari+mint&btnG=Search

What will be a good method to have access to gcc, gcc, ld, gdb, ...
and emacs or vi on the aranym. Any pointers are welcome !

Should I pursue mint ? which version/type ? which desktop ? ... ? If
you have an disk image that I can boot from that would be great as
well.

Regards,

-Luc

I have PSU problems it seems. Main cumana enclosure just about spins the drives up. Just bought a new JMR SCSI enclosure which has a 2amp switch mode in it, that won't it ever power any thing up at all (there is power). So currently have wires hanging about everywhere at the moment and using a PC ATX power supply.

Bit power hungry these drives.

Hi there :)

Ohhh pretty safe really. The sweat to go through to mass produce it I don't think anyone would be prepared to do. The PCB's for example were about £250 ($500) alone. Someone would have to have a hell of alot of faith in the project to go out and do that. The only reason we did it was because we were comfortable with how it worked, designed it, and literally knew it inside out. Overall with it being mass produced I can make about 1-2 an hour. Without the 'modular' pieces of it I would image it would take ages.

Name is on the PCB, and the MCU is code protected such that the data can't be read off of it. :D Also lots of quirky stuff in there too.

Not that many of you know this, but your PeSTs, if you connect certain pins of the chip to a 38400 RS232 port you can see what's going on, like when the mouse initialises, and when PeST checks the mouse every 2 seconds to make sure it's the same one. :D

Moving into other projects now so comments noted, thanks atarisales :)

Then it would be easier to rewrite/update/modify it to run under Linux
first. It should not be a problem to compile/make an Atari version
afterwards using gcc.

If you want to compile your program natively under MiNT, then you'll need
one, but you have a third alternative, that is to use a cross-compiler
(i.e. run the compiler under Linux to generate an Atari executable). There
are some binaries already available on sparemint website, or you can
compile the cross compiler yourself. There are some tutorials about it on
the web.

> Should I pursue mint ? which version/type ? which desktop ? ... ? If

I don't think current Aranym disk images comes with dev tools, or the
minimal mint setup needed for installing rpm stuff from sparemint website.

Hello

If you get a Seagate, do not pay much for it. They often have a capacitance problem, work in Seagate's test fixture, but not in the real world.

My TT has an adapter to SCA, which was not cheap, and is at the moment extremely happy with a 9.1 gig Hewlett Packard DNES-309170. On the other hand, found a batch of them on E-Bay, the first had bad sectors only found with H.P.Vetters Optimizer program, but the next three were fine. It can shut parity off.

My general advice is to get more than one of whatever you find, just for luck. The one new drive I bought from a computer store has not worked yet.

Compaq have given me some odd problems. They can do narrow bus transfers, and if they work at first, they will last for a while. What some of these did to me was to add one bit to some characters being transferred, sometimes.

In short, I have quite a number of drive magnets pulled from pulled drives.

Your largest problem will be providing TERMPWR to the LINK. It has to come from your external drive. All my drive boxes have a diode from 5v to the TERMPWR wire.

My adapters come from CS Electronics, which was hard to find using google.

If you can find them, look at the prices, which are typical, assuming you can find anyone else making what you want.

The bottom line is that adapters are available, and reliable, and drives are surprisingly variable. How is this for a start?

Jim

techie_alison <retro@dial.pipex.com> writes:

: What is the arrangement with SCSI hard drives and the Atari ST? I've just
: acquired an ICD LINK adapter and am trawling the web at the moment for
: lowish GB SCSI1 50-pin drives.

: The Seagates seem to come out top as there's specifically a 'parity' jumper
: on them.

: Can 68pin or 80pin drives be used with an adapter, or does the 16bit
: transfers create an issue?

: Would it be possible for someone to give me an idea of what I'm looking for?
: As trawling eBay at the moment I can pick up plenty of these Compaq
: ultrawide drive pulls, assuming they have a SCSI1 mode and can perform 8 bit
: transfers.

: The ICD Link btw will recognise my SCSI Cumana (was for Acorn BBC
: Archimedes) drive, so is assumed to be functional.

: Thanks kindly in advance,

: Aly

I did the same thing too, and it works just fine. Took a while, but
worth it to revive the TT. Luckily I had a TT service manual (purchased
from Best), so I could check out the connections & make sure all of the
SMD socket pins were soldered properly.

Actually I have a couple of different ones, and they both work well. I'm using them on the TT to test out DVD support via SCSI, and I've also tested REALLY large partitions. But what I'm hoping to get by having an IDE port is faster data transfer. The SCSI chip on the TT won't go any faster than about 2 MB/sec. IDE should go faster.

Having more money than sense, I am in the process of getting a hot air surface mount component removing tool, and a complete set of nozzles.

I have cut the pins off chips with a dremel tool and a cutoff wheel, and the drag on the pins pulled pads off the board.

I am not sure how anyone could use my very expensive toy, but it is (or will be when I get the nozzles) available to solve little problems like that. One of my TTs has a dead printer port, and that will be my first project.

Jim

7230. printing index cards

Newsgroup: comp.sys.atari.st
Date: 2006-07-01 20:02:59 UTC
From: Jim DeClercq <jimd@panix1.panix.com>
Message-ID: <e86kdj$5rr$2@reader2.panix.com>
Source record: 8007

Someone wanted to know how to print index cards. I do not know for sure, but gemvelope has .glp files for cardfile and for cardfile4, and puts words about a merge function on the screen, implying that one can merge a cardfile file into something about the size of a small envelope.

I would know more, but sometimes Gemvelope gets confused, and thinks I do not have enough memory. When I get it unconfused, or if I get it unconfused, I will know more.

7233. June winners/July prizes...

Newsgroup: comp.sys.atari.st
Date: 2006-07-02 19:15:05 UTC
From: "Ronald J. Hall" <dark_lord@charter.net>
Message-ID: <pan.2006.07.02.19.15.05.844806@charter.net>
Source record: 8010

Greetings everyone!

Here are the lucky, the few, the proud winners of this months prizes at
The DarkForce! BBS:

June 2006
1. Final Frontier 2 - none (game rolled over to next month)!
2. ST Magazine - Doctor Clu wins the free 3 mag. subscription!

Congratulations to our winners!

Also, here are next months prizes:

July 2006
1. Final Frontier II - one lucky winner, or *team* will win the $75.00
prize. Team members will divide up winnings. If the game goes into more
than one month, that months prize money will be included. As sysop, I will
be playing, but am exempt from winning, or joining any team.
2. ST Magazine - some lucky Atari caller will win a free 3 mag.
subscription.

Good luck to all! :-)

Hey group,

Can someone (or many someones) lay out for me the strengths and
weaknesses of their favorite Atari ST emulator(s)?

At one time, I was somewhat "up" on the state of the art, but things
have very probably changed since I last played with any of them.

Oh, and I'm not interested ONLY in solutions for WinDOZE, since I run
Linux and OS X too.

Thanks for your help,

Joe Mirando
A-ONE Magazine

7235. Linux or MiNT: Which is "better"?

Newsgroup: comp.sys.atari.st
Date: 2006-07-03 19:54:44 UTC

Hello again, all,

At one time, I was running Debian Linux on my TT, but it was so slow
when running X that I gave up on it.

I now see more people talking about MiNT/SpareMinT and whatever else.
I've been out of the loop for a while, and was wondering if one or two
of you kind souls could help out an old Atari user with stuff like pros
and cons and where to find some of the cool stuff that you'll no doubt
be mentioning.

Thanks,

Joe Mirando

Hey Joe.

Here are some URLs to start with:

http://atari.st-katharina-apotheke.de/home.php?lang=en&headline=EasyMiNT&texte=easymint
http://sparemint.atariforge.net/sparemint/

Also, I'd subscribe to the MINT mailing list, just send an e-mail with
"subscribe mint" as the message content to:

majordomo@fishpool.com

Read, ask questions - this will get you started. :)

You can't possibly compare the two. Linux is a completely different
operating system than the built-in TOS. There is absolutely no way to
run a TOS/GEM program under Linux on an Atari compatible computer.

FreeMiNT is, in a sense, the latest version of TOS. SpareMiNT is a distribution
of FreeMiNT that contains about everything you would need. EasyMiNT is
a simple installer for SpareMiNT, which doesn't have an installation
program.

7241. Bnet

Newsgroup: comp.sys.atari.st
Date: 2006-07-03 23:44:06 UTC
From: Claude Bourgoin <claudeab1@adelphia.net>
Message-ID: <mpWdnY5kvbwnMDTZnZ2dnUVZ_vudnZ2d@adelphia.com>
Source record: 8018

I have been trying to connect my falcon and TT using Bnet. After Bnet is run I see the Bnet drive on both compters. When I click on the drive on the TT I can see the falcon folder but when I double click on the folder it says it is empty. The same thing happens on the falcon except when I dbl click on the TT folder, I get a message Cannot connect to drive.

The Falcon is running magic 5.11w/sting installed. The TT is running TOS 3.06 and sting.
Bnet Is run from the Magic start folder and on the TT it is installed as an .ACC. Both the TT and Falcon I connected with Daynaports to my router. Both TT and Falcon are able to access internet thru the router which is connected to a cable modem.

Has anyone had any success with Bnet. What is the rules for setting the Hosts.inf file? Do I need tabs or spaces between the parameters?

Thanks.
Claude Bourgoin

Has anyone

Do you act for the living of the ATARI platform, or do you only speak ?

Act are in the real life ... Words are vanishing :(

I'm an author of <http://ebmodel3.atari.org/Pack_3D/>, it is a real
act, not only words. You probably didn't do something similar.

I wish you could understand ;)

7243. VME / Riebl card help wanted

Newsgroup: comp.sys.atari.st
Date: 2006-07-04 16:36:38 UTC
From: Roger Burrows <sergeantvimes@yahoo.ca>
Message-ID: <kb5la2lgrsjln7bcn0v1ljmt1ca5f5fckn@4ax.com>
Source record: 8020

I have a Riebl card which doesn't want to work in my TTs. Since I have tried the same card in 3 different TTs, and I have a different VME card which does work OK, I don't think it's a TT VME problem.

Using the Devpac debugger, I can read & write the memory ($fe010000 -> $fe01ffff) on the card, but as soon as I try to access the memory-mapped I/O ports at $fe00fff0 I get a bus error. If my understanding of the Atari VME implementation is correct (this is a big "if"), this failure is (or can be) caused by the board not responding within 255 cycles of 16MHz.

Is there anyone familiar with this board or this kind of failure who can suggest what might be the failing component on the Riebl board? My thoughts are that it might be the crystal or the Lance chip itself, but I only pretend to know a bit about hardware ...

FWIW, there are no obviously overheated chips, blown resistors, leaking caps, bad solder joints, shorts, breaks etc on the board itself.

Thanks in advance for any & all suggestions,
Roger Burrows

Well, Joe asked for the strenghts and weaknesses of the existing emulators.
If you think that this "speaking" doesn't deserve an answer that goes
further than "try my emulator I'm the author try it I did it", you could
at least reply to the question and tell us, as requested, its
strenghts (apart "I'm the author") and weaknesses (apart the fact that
you're the author).

Simon

Sorry ... Who are you ? Because I know Dbug ? Not about you sorry !

The best thing to speak about 'emulators' is to discover them first.
My answer perfectly fits to the topic that was launched by the primal
post. Are you kidding me ? Did you experienced 'emulators' ?

ATARI rules !

I suppose that you know that the jumpers on the card must be set
differently depending on whether you use it with a TT or a MegaSTE?

Hello Joe,

I run Linux myself and have a bit of experience with Steem. I currently use the latest Ubuntu Dapper Drake distro on an AMD64 running in 32 bits, a quite powerful machine.
On my computer, the sound is quite horrible and the video is not as smooth as on Windows, I have quite a lot of frameskip. By the way, I never run Steem as 'setuid root' because I simply hate running stuff as root ;-)
Beside that, Steem is as stable as under Windows.

I never tried any other emulator on Linux. I hope it helps a little.

Btw, Rajah said: "carefull : troll contamination from fr.comp.sys.atari"

May I *deeply* emphasis on the fact that I'm not the only author of
<http://ebmodel3.atari.org/Pack_3D/>, that I share its genesis with
Olivier Landemarre and Emmanuel Baranger. That this package is
derivate from ARAnyM, from which we also are not the *only* authors.
That ARAnyM is a *virtual machine*, so not properly speaking an
'emulator'. That if you give a try to this *package*, it supports
Linux, MacOSX and Cygwin (Windows). And that it worth discovering
to see the evolution of what were called ATARI 'emulators' before
this kind of machines appeared. ARAnyM means 'ATARI Running on Any
Machine' and it has a GNU/GPL status.

If I'm not totally answering to all questionings, what am I doing ?

Hm, from what I remember about Atari machines (or more specifically ST) emulators:

- Pacifist: was running under DOS, works also under Windows.
- Saint: Windows.

These two ones were meant to only run games and demos, so most work has been put to accurately emulate the ST hardware. There are some enhancement, like running the emulated 68000 at a higher frequency, useful for people still developping ST software.

- Steem: Windows, Linux.
- Hatari: many systems.

These ones are still ST emulators, and also get some enhancements, like having some higher resolution modes, mapping some host directory as hard disk, etc. I prefer these two ones for running pure ST stuff, because I only run Linux.

- Aranym: many systems.

This one is more comparable to an Atari clone (or a Falcon with an AfterBurne040 board), having a 68040 emulated, running the Falcon TOS, so you can run some Falcon programs, but the hardware emulation is far from complete. Useful to develop non 68000 stuff (for 68020 or higher CPU, with FPU).

- Nostalgia, castaway, gemulator.

I don't know these ones, so you'll have to google them yourself.

You are just boasting your ego in meaningless ways.

What you could have said, is that:

Strenghts:
- It's multiplateforme
- It's probably the fastest atari compatible system available
- Supports things that other atari systems only dream of (like native large resolutions and built in modern peripherals)
- (other ?)

Weakness:
- It's not modeled after specific model of Atari, and cannot be used to use any application that is too close from the hardware (demo, games, ...) only Gem based applications
- (others ?)

How hard was that ?

Dbug

There's also the *first* ATARI emulator that is called STonX GNU/GPL

<http://www.complang.tuwien.ac.at/nino/stonx.html>

from which ARAnyM inherits a lot :)

A Java ATARI emulator <http://www.atari-st.lovely.net/>
TOSBox at <http://www.geocities.com/tosbox/> (Windows)
STEmulator <http://www.stemulator.net/> (Windows)

That's without speaking of MagicMac or MagicPC that are available
at <http://www.application-systems.de/atari/>.

Some others have disappeared from internet like TOS2WIN from Aixit,
or WinSTon etc.

Do I have forgotten anyone ?

Hi,

Is there a site which details which Atari ST items hold rarity? I'm thinking of something similar to the Atari 2600 sites which literally detail everything.

Over the last few months I've acquired the most ridiculous amounts of Atari ST kit that you could imagine, such that I really don't know what to do with it all. I certainly can't keep it so was going to pass on rare items so others may appreciate them. I just don't have the heart to take it all to the dump.

Thanks,

Aly

Hi Aly! I don't know if there is such a site, but you could always
post a list here and ask people to comment on the rarity of items.
My comment would be that most stuff is not very rare with the
exception of ICD or "LINK" host adapters. Of course everything is
rare if someone is looking for it at the time :-)

Mickael,

> He did not asked for links on where to download emulators, but on something
> specific...

Oh hell, we've all been in the Atari arena for so long now that if we
can't be happy to get whatever we can from anyone who wants to offer
something..... well, I guess we'd move on to WinDOZE and just forget
about Atari all together. ;-)

In short, I'm more than happy to take ANY information that anyone wants
to provide.

Actually, if I had been thinking, I would have also asked for links too,
so he actually saved me from having to ask for it. <g>

Francois,

> Act are in the real life ... Words are vanishing :(

Heh heh... Sort of a variation of Saint Paul, is it not? ("Faith without good works is dead"). While I do not want to interject religion into this discussion (oops ;-)), It IS an interesting point, and one which fits within your reply. :-)

> I'm an author of <http://ebmodel3.atari.org/Pack_3D/>, it is a real
> act, not only words.

Speaking for myself, I only WISH I had the talent to write code like that. I realized very early that I would never be a programmer. While I could flowchart and code, if you looked at my work and measured it against that of a REAL programmer, mine was 'ugly'. The 'real' code and flowchart was.... elegant. I can appreciate the beauty of well written code, but the ABILITY is what I lack.

Thank you again,

Yes, and I think I have them set correctly according to all the docs I
could find online. According to the Linux driver source, the memory
addresses for the TT & MegaSTe differ, and the addresses I can modify
correspond to the TT setting, so I'm pretty sure that part is right.

However, I do have a MegaSTe, so I should try it on that as well, thanks
for reminding me!

Of course, what I really need is a schematic (yes, right) and a 'scope,
then I might have a reasonable chance ...

I haven't come across such a site, but here's a list of some rare-ish
items (including stuff for TT):
260ST
2080ST
STbook
STacy
>4MB RAM upgrade for ST systems (Marpet?)
CDAR504 CD-ROM drive
Atari Laser printer & supplies (drum etc?)
3rd-party TT RAM board for TT (supporting > 16MB)
8MB ST RAM board for TT
VME boards for TT/MegaSTe (ethernet, video)
TT monochrome monitors

I welcome any corrections or additions to the list.

Roger

Hi Roger,

good point to start with ;-)

List of rare Atari ST series items:

RB> 260ST
RB> 2080ST
RB> STbook
RB> STacy
RB> >4MB RAM upgrade for ST systems (Marpet?)
RB> CDAR504 CD-ROM drive
RB> Atari Laser printer & supplies (drum etc?)
RB> 3rd-party TT RAM board for TT (supporting > 16MB)
RB> 8MB ST RAM board for TT
RB> VME boards for TT/MegaSTe (ethernet, video)
RB> TT monochrome monitors
RB>
RB> I welcome any corrections or additions to the list.

4160STe
DMA and MegaST bus networking solutions (PAM's, Bionet)
MegaST bus graphics cards, math coprocessor cards
XT/AT emulator boards (PCSpeed, ATonce and the like)

in general: almost any hardware extension

Regards,

Alexander

Hi Francois!

> Sorry ... Who are you ? Because I know Dbug ? Not about you sorry !
>
> The best thing to speak about 'emulators' is to discover them first.
> My answer perfectly fits to the topic that was launched by the primal
> post. Are you kidding me ? Did you experienced 'emulators' ?

Do you know why I know quite a few people who dislike aranym?

Because of incredibly arrogant posts like those of yours in this thread.
Quite unbelievable :-(

Now to answer the OP's question:

MagiC-PC (Windows, Linux with wine)
========
It is the most comfortable and stable one. Under wine it has graphics
errors, but still runs!
It is also very fast. However it costs a lot. Still!

Aranym (cygwin, Linux):
======
Lots of tiny issues here and there, but it runs MiNT+XaAES, which is
great. It is very unstable under CygWin. On Linux it is quite okay, but
by far not as comfortable as MagiC-PC. Pity, because MagiC really sucks.

Steem (Windows)
=====
I think there is a linux version, but I dont use it. Steem is perfect
for hardware close stuff (debugging, old games etc.). It has a very good
GUI and is a piece of cake to set up and use!
But you can only run TOS on it, but any TOS version you like (again good
for testing).

These are the emulators I know and use. I have stopped using aranym
again, because under CygWin it is just too unstable and I dont know why
(aranym? fvdi? libSDL? Windows? cygwin? who knows)

Cheers, Ingo =;->

Well ... It's difficult for me to answer. Would you tell about your
latest born baby his defaults and qualities, compromising his future
regarding to other peoples. Well ... It will lives its life :)

But I'll try an answer.

The problem is that ARAnyM is young. It has not yet reached its 1.0
version. This is a very ambitious project. And with a community
development, it relies on volunteers that can spend time and
efforts for it.

The very strong point is that the package that is released includes
3 host platforms, but it could include more, with a strict same
behavior on every hosts. That means whatever hardware suits
to your preferences, you can exchange knowledge with any other user
or developer. And it is a true ATARI platform, like it should have
exist if ATARI Corps had followed the production of hardware.

> Since the release of ARAnyM, I have been interested in the philsophy of
> a "virtual machine" as opposed to an "emulator". Could you explain the
> difference to me?

Well, many things have already been said on that point, and it is a
sensitive point in discussions, everyone having one's own opinion.

I would say that an 'emulator' tries to fit the closest to the
originating hardware, and a precise machine, to have as much
existing softwares to work properly with it, even if it is badly
written. Most of supported software are non still maintained (games).

A 'virtual machine' tries to take as much portable features as
possible to be extended to the most recent software and hardware
abilities of host machines and operating systems.

An 'emulator' is intended for nostalgia. A 'virtual machine'
prepares the future of ATARI hardware and software.

Howabout this question:

Are there any that support any useable connection through STinG?
I've tried to tunnel a ppp connection through STEem using a
bidirectional pipe into STEem's emulated serial port, but it's
far too slow.

I was hoping to be able to use a bridged TCP/IP subsystem much
in the same way that VMWare does, but no avail.

Anyone?

I've not being built a cathedral ;) I've only build a 3D package with
two friends and the help of the ARAnyM community ... It's very
difficult to speak about creation without references to religious
concepts. I'm just speaking with common sense :)

I realize when I was teenager that I would never reach the genius of
authors from bars arcade games that I was playing. My only merit
was to react that I could learn, and work on some programs that
nobody else would write in place of me. It has some interest for me,
and might perhaps be useful for somebody else.

Your interest is my reward :)

I'd like to strongly point out that Franï¿½ois Le Coat is *not* one of the authors of ARAnyM, contrary to what he is trying to make everyone believe in this thread. He helps package the Pack3D "distribution" of ARAnyM and tests and packages ARAnyM a lot, though.

> Since the release of ARAnyM, I have been interested in the philsophy of a
> "virtual machine" as opposed to an "emulator". Could you explain the
> difference to me?

No one other than Franï¿½ois uses the term virtual machine now. It was used at the launch of the ARAnyM project to diffenciate it from emulators that were trying to emulate an original Atari computer as close as possible. ARAnyM is more like an Afterburner040 emulator, whithout some Falcon stuff.

Code like what? Pack3D is a distribution of ARAnyM (and a very good
one) with some applications added. Not a program. Unless you were
talking of the said applications?

I have PC speed for the ST and Falcon Speed. Also Ram Gizmo for Falcon number 2. A few Plug in expansions like the Happy cartridge, Romantic Robot, Supermon for the 800XL (anyone have a spare pokey;-) probably more I can't think of atm. Seriously wife agrivating tho I don't know why;-).

CT2 Falcon
Falcon030
TT030/2 w TTM195
MegaSte4
1040STe (4mb & TOS 1.62/2.06)
520STM
5 520/1040 STFM's
800XL (256K, SIO2PC and Supermon)
130XE
800XL
600XL (64k, Chroma-luma)
XEGS
Jaguar
Portfolio
Lynx II
2600 Junior
2600 Darth Vader

Also some bits that need restoring another 130XE and MegaSTE. And 2 MegaST's. A few weird monitors as well. Ah blessed is Atari and all those that worship at its temple;-)

Mark

About Pacifist I used some time ago, it's a great emulator when your
host is an old machine with no much power. I installed it on a 486DX/50 with
4Mb. It was a notebook, so I had a kind of "Stacy" I could travel with,
bring it to work, etc...
Close to 3Mb of ST Ram, enhanced graphic modes (the best was
640x480xmonochrom), and with NVDI I was close to the speed of a Mega STE
without NVDI.

You could run color applications (640x480x16) but with a jerky screen
and slow reactions from the computer. In monochrom, it was great, (Everest,
Assemble, GFA Basic, Interface, etc...). I didn't use it for games.

I have never tried to run PCDitto under Pacifist!

That was my experience.

Guillaume.

About Aranym,

I would say that, it's more a TOS+GEM emulator rather than an Atari
emulator. I mean that you can't run a "dirty" program (as many of mine!)
that makes direct access to the hadware. But you may run the others that use
standard and documented calls to BIOS, VDI, AES? etc...
Finaly, slow programs on Atari that used to respect everything are speed
up under Aranym. Fast programs on ATari that used to take advantage of every
easy way of hardware just won't run.

I could say that Aranym is a booster for bad programs, but I won't!
I didn't say it!
No no no, I didn't! It was just a joke!

Guillaume.

You're misinformed. I maintain the MacOSX version of ARAnyM building
snapshots that are located at <http://eureka.atari.org/MacAranym.zip>
and building official releases. And also maintaining a boot disk image
from which the Pack_3D derivate, that is located at :

<http://eureka.atari.org/xa-my-aes.zip>

At this title, I built the OSX and Linux binaries for the Pack_3D,
and gave a great hand to Emmanuel to build his diskless configuration,
notably obtaining the way to configure the internet from you J-F.

Don't you know that ? Did you forgot ?

>> Since the release of ARAnyM, I have been interested in the philsophy of a

> whithout some Falcon stuff.

I suggest you to extensively discuss with Petr, what I have done
since all these years on the ARAnyM mailing list, to understand his
attachment to this 'virtual machine' concept. If you carefully read
the home page of ARAnyM, you will see :

"
ARAnyM is an acronym: Atari Running on Any Machine. It is a *virtual
machine* software for running the Atari ST/TT/Falcon operating systems

(TOS, FreeMiNT, MagiC and others) and TOS/GEM applications on any kind
of hardware - be it an IBM clone (read it as "PC" :-), an Apple, an Unix
server, a graphics workstation or even a portable computer.
"

I have not much to add about the reliability of your arguments :(

Regards,

Hello,

Just a small fix this time, related to the GEM mouse cursor management.
The cursor also revert to an arrow when outside of the application window.

Available on my site as usual.

I still have an old catalog around somewhere I think.

Also I have the original spec documentation for the ST from 1984. All
labeled top secret etc, etc. That I'm keeping;-)

My CT2 woops the TT, but even that is rare in Australia. Probably never
see a real CT60 though I think Austin has one out in western Victoria:-(

Hi Joe & All,

Thanks for the replies here, what on earth have I started!! ;-)

Joe, I think I need to priv-reply to you... Everyone, Joe kindly sent me a message a week or so ago and I haven't replied to. Yes I'm feeling guilty! I'm just being incredibly crap at checking (and replying) to emails at the moment, just started a new gym membership n stuff.

Anyone have any ideas on how we could bring all of these 'rare' items together? I'm thinking an SQL database somewhere with a basic (very) PHP front end. No graphics or anything, just the ability for people to blindly submit what they have in text form. Could be one of our greatest combined projects... Not talking any registration or any of that rubbish, just the ability for people in their moment of enthusiasm to enter what they have into it.

Views? Anyone have a server out there with SQL and PHP on it?

Well not emulator is perfect. The best one will run just about everything and
at the same speed on the original ST. The best one for Windows that I have
found is STeeM. This one still needs an original ST to save out files that
will later be ran on the PC. I was surprised that I was able to run copy
protected games/programs.

Geez, you were able to get X running on the TT using Debian Linux? What version of Linux are you running. I have the Sarge version and cannot get X running yet. I also am using Mint and trying to get version 1.16/XaAES to run right now. Which one do I prefer? Right now it is Mint, but I am not going to give up on Linux. I would keep both.

7293. TeraDesk 3.83 released

Newsgroup: comp.sys.atari.st
Date: 2006-07-08 13:42:42 UTC
From: vdjole@EUnet.yu
Message-ID: <e8ocog$o0n$1@news.eunet.yu>
Source record: 7920

Version 3.83 of TeraDesk open-source desktop is available at:

http://solair.eunet.yu/~vdjole/teradesk.htm

This is a bug-fix and code-optimisation routine. Several bugs, including
a bad redraw and message-handling problem that manifested only in Magic-PC
were fixed. Functionality of some features was improved and a number of
simplifications were made in the code so that program size is now less
than it was in V3.80. Also, the hypertext manual was updated.

See the history file for more information.

Have fun.

Just curious....over the past few months, I have received e-mails from a few members of our A-ONE e-mail subscription list stating that they hadn't received a particular issue. A-ONE is sent out every week, on Friday evenings. Since I only hear from a few, I usually assume that the problem is on their end, not ours. However, I have noticed that in the last couple of months, I have not received the mailing either (I include myself as a test). So, I'm wondering if this is more widespread than I had imagined.

If you are a weekly subscriber to the A-ONE mailing list, and have not been receiving our issues on a weekly basis, I'd like to know. This week's issue didn't make it to me, so if you also did not receive it, I'd appreciate hearing from you. If you did receive it, I'd like to know that also! Rather than cluttering up c.s.a.s., please let me know via e-mail at dpj (at) atarinews.org. Thanks!

Hi,

The <http://eureka.atari.org/xa-my-aes.zip> boot disk image
for ARAnyM 0.9.3 is updated according to released contents.

- Teradesk 3.83 the GEM desktop.
- EB_Dump 0.9.7 the GFA screenshot accessory.
- freeMiNT/XaAES the system's snapshot from 2006/01/29.

<http://eureka.atari.org/MacAranym.zip> for MacOSX.3.9
(or better) is also kept up to date corresponding to
the disk image. It is a ready to start package that runs
on PPC/OSX machines (G4 or above).

Have fun !

Hi all,

As usual NAS was was a nice event! Amongst the attenders there were (apart from myself) ;) Ozk, PeP, MRF and a number of other local Atari ppl, Knezzen and Nick Harlow of 16/32 systems. As XaAES has started to look like a fullworthy replacement for the Atari AES, it was only natural that the main focus during NAS2006 was aimed towards Ozk and his work. Ozk himself was treated with a 68000-machine with a SCSI-disk attached, in order to provide a useful testing setup. A number of bugs that for quite some time have prevented the FreeMiNT kernel from running on 68000-setups was found and killed. There are still some things that needs to be fixed before it will be commited to CVS though, so please be patient. Apart from this, it was of course very nice to see Nick of 16/32 Systems again! He brought some hard- and software with him and was a very appreciated guest at NAS!

See pictures from NAS2006 here: http://nas.atari.org
The official NAS/SAK website: http://www.sak.nu
More about XaAES: http://xaaes.atariforge.net

Does it already work in B&W? Much depends on whether the printer is
still backward-compatible with the level of PCL that NVDI provides.
Make sure that you've got the latest(!) version of NVDI from the web
site.

As for colour, I think you're on a losing wicket I'm afraid!

Anybody got any excess gear they want to part with? I'm interested in pretty much anything SGI/SUN/Unix/Amiga/Commodore/Atari/Server/Video Game/Weird/Classic/Retro/ETC that you don't wan't in the Puget Sound area that you'd prefer not to toss out. Can't pay you but I'll give it a good home and it won't end up on Ebay.

7305. [GAME] pmdoom 0.53, and request for teamtap owner

Newsgroup: comp.sys.atari.st

Source record: 7932

Hello,

Here is a new release with some fixes and improvements:
- Fixed low detail routine for networked player sprites.
- Fixed crash in audio on exit.
- Unrolled 4x rendering loops, a bit faster.
- Tried to make 060 friendly asm rendering routines.

Yep, it seems asm routines I wrote for rendering were not optimal for 060 cpus, so I rewrote them in part, with nice advices from Mikael Kalms and ray/tscc. I think that they could be improved a bit more, but I don't have time for that, as both Heretic and Hexen still have the C renderer routines.

I also rewrote the joypad support for SDL to support Jaguar teamtap adapters on STE/Falcon, but I need owner of this hardware to test it. Contact me if you have some.

The printer doesn't respond to the PCL driver that gets installed for
my venerable DeskJet 500. I have tried a couple of the other listed HP
enties without success.

Ok, let's try starting this thread afresh, since it got off on the
wrong foot:

-Aranym(multiplatform): Well, 'nuff said by others
-Steem Engine (window$/linux): The most usable atari st emulator. Very
complete and precise emulation of the ST/E hardware. Supports virtual
hard drives, so it can be used for most apps.
-SainT (window$): Another good emulator, but not as complete as steem.
WinSTon (window$): develompment stopped. Looked nice though
-Hatari (multiplatform): WinSTon with UAE 68000 emulation. Lagging a
bit from steem and saint, it is nevertheless interesting.

There are also others as you already know (StonX, TOSbox, STEmulator,
FaST, Pacifist, Echo, Gemulator), but development for those has
stopped for a long time now.

hth,

DESKJET500 is not a laser printer. I think it doesn't even understand
the postscript commands.
I successfully use that dj500 driver for every deskjet HP printer I had
(and have) but NO laserjet printers.
hope this helps

Hello Edward,

The last few weeks you've send me some e-mails. The replies send to your mail account bounced back however. It seems the mailservers of my ISP are blocked.

I did make a request to put the servers back on the list.
They have removed one server but alas it seems I'm not using the same mailserver all the time. My next reply bounced back again as I was using another mailserver as the one I used previously.

I'll send you the IP by private mail (via Paul Williamson, I hope P. W. will get throuyh).

I always loved Winston, its sources were available for a while IIRC.
Oh and someone recompiled it so it ran faster, and the result was called
STEW (I think the initial idea was to carry on Winston development, but
AFAIK it stopped)

From: techie_alison <retro@dial.pipex.com>
Message-ID: <c7SdnaTso4VxiSvZRVnyqQ@bt.com>
Source record: 7940

Hello,

Would anyone have a source of Dtype connectors, both male and female for the ACSI port? Hoods would be nice also. Say 5-10ea. with payment via PayPal.

There's just one company I've found that has remaining stock but with an insistance of charging me $114 postage so it's no wonder they still have stock on a 15 year old specialist product.

Thanks,

Aly

Hello, Aly!

t> Would anyone have a source of Dtype connectors, both male and female for the
t> ACSI port?

Sorry, but my former source <http://www.reichelt.de> does not list 19p
d-sub connectors any more.

The only place that I found anything alike is
<http://www.partsdata.de/Atari_und_Amiga--Zubehoer_fuer_Atari_ST_u.a.--mechanische_Bauelemente_shop.html>.
They list female 19p d-sub connectors, both for PCB and cable mounting.
But no male ones, sorry.

So if anyone else has a (new) source...

Regards,

Alexander

I'm trying to get you to check whether the printer supports PCL5 or not
- as has been pointed out, this is a laser printer and not an inkjet.

But there is of course only one way to find out.

Give me a few days and I'll dig back through the old emails. I'd even
mailed then to check that this was really true, was a US company too, they
didn't care, just some telesales person answering an email. $100 odd
dollars to send something weighing 100 odd grams.

Thankfully I only charge people what it costs to post items (ie. PeST),
anything above that is taking the proverbial.

rant over :D

I didn't know anyone had a warehouse on the space station!
I bookmarked this along time ago. Didn't look for hoods. They state shipping
as $5.50. In the US I presume.
Good Luck.

As far as I can see the printer only supports PCL6 and Postscript Level 3.
NVDI only supports PCL5 which is not a sub set of, and is not compatible
with, PCL6. Can you define some kind of Apple laser printer in NVDI. I think
that might be the best bet. You may also have to
tweak the settings some where....

The Best Electronics catalogue shows 19-pin solder cup connectors (male
& female) @ $3.50 ea. and hoods @ $1.50 ea. The addendum of
13/April/2006 doesn't mention any update, so I assume they still have
them. Best Electronics are at: www.best-electronics-ca.com/.

Assuming this is a US company, I wouldn't be surprised if the shipping
was much more reasonable if it was within the US. You might well find
it worthwhile to find a trusty friend who lives within the US, have the
company ship it to them, then have them ship it to you ...

Obviously I didn't make myself clear, but I think that David Wade has.
I mentioned the DeskJet because I believed that, if the Laser printer
is compatible with PCL 5, it should have responded in some fashion to
the DeskJet driver. That it did not led me conclude that it was not
compatible.

I have also tried some of the older laser drivers that come with NVDI
without any success.

All I can suggest is "keep looking". I have five males of those, thinking
I would have to build an unavailable cable. They did not cost much,
shipping was reasonable, and I paid either by credit card or paypal. But
it was long enough ago that I do not remember where I found them.

As I recall, I typed DB-19 into Google, and looked through results until I
found them.

This email is to inform buyers of "On the Edge" that the first bonus chapter is now freely available online. This chapter fits somewhere between Chapter One and Chapter Two, right after the 6502 development and before the Commodore acquisition. The content includes the early development computers by MOS Technology (and later Commodore) and the beginning of the personal software industry. You can download the chapter from www.commodorebook.com in the bonus section.

Readers of "On the Edge" can also benefit from an exclusive 10% discount on the brand new Amiga Forever 2006. The DVD set that is part of the Premium Edition of Amiga Forever has some incredible footage from the early Amiga days. To take advantage of this offer, which applies to all editions of Amiga Forever, order from www.amigaforever.com before July 31st, 2006, and enter "AFCBM" in the Discount Coupon field of the order form.

My wife has a HP 2100 laser printer. I chose one of the HP laser drivers on the NVDI list and it worked fine, but I will admit I only printed text and not graphics. I would just keep trying the various ones out until one works.

7337. The XaAES online documentation

Newsgroup: comp.sys.atari.st
Date: 2006-07-16 11:43:00 UTC
From: GokMasE <gokmase@gmail.com>
Message-ID: <1153050180.195432.263510@75g2000cwc.googlegroups.com>
Source record: 7964

Hi all,

We have recently been working hard to supply a thorough and accurate documentation for XaAES. Chances are that even advanced users will be unaware of certain features and shortcuts, and since XaAES has had such a tremendous development lately, chances are that new users might be interested to check it out. Hence the need for proper documentation!

The docs might seem too include details some will find trivial at times, but there is a reason for that too - by covering such information as well, the documentation can also serve as a reference for the GUI components.

Nowadays it is absolutely fair to say that XaAES despite its alpha status is a very stable and mature project, that definately has reached the original goal - to offer a free replacement for the AES in MultiTOS. Many would say that it even leaves N.AES behind.

You will find the online documentation on the XaAES website:

http://xaaes.atariforge.net/

Regards,

/Joakim

I'm one of those who states XaAES leaves N.AES behinds.
I really don't have any reason whatsoever to fall back to N.AES.
And yes despite it's alpha status it's rock solid (at least on my
setup).
Sure there are still some issues which needs to be fixed but as far I
can tell these issues are minor and doesn't affect the good working of
XaAES (latest cvs version).

>
> You will find the online documentation on the XaAES website:

Well done Joakim. I'm sure the docs will be a good source for both the
layman and the experienced user.

Wonderful job, Joakim. The only problem with that documentation is that it reveals those nifty new features (mainly the window context menu) that aren't available yet to us users :-) Someone will have to release an updated version of FreeMiNT.

You can always grab the latest version from cvs. It's not that difficult
to install a working Concurrent Version System (CVS) on your system.
See
<URL:http://sparemint.atariforge.net/sparemint/cvs.html>

Excellent! I am very glad to hear that there is a lot of interest in
the docs! :))

Yes, that is true. The window context menu is a very recent addition
and I should have made sure that I had current binary available on site
before publishing the documentation. One of the main ideas with the
unofficial XaAES page is to offer fairly frequent updates in binary
form, so that users should not have to go through the process of
installing dev tools in order to get a working product :)

I will look into uploading current binaries before I leave for a short
holiday trip later this week.

Hi Edward,

ESBJ>My wife has a HP 2100 laser printer.
That seems very interesting.

ESBJ>it worked fine, but I will admit I only printed text and not
ESBJ>graphics.
Even it did not put out graphics, I'd like to know if any program
permitting interactive output would provoke a printer's reaction.

E.g. TEMPUS editor permits to put ESC sequences into the text, or any
DBase compatible soft permits to give out via the '?' (question mark)
commands.

If the printer does so, at least one could give out features like bold
or italics, formfeed and others...

Ok, the binaries should be up for download now! These files are however
100% untested, but hopefully the 030 and 040 versions will be okay. the
000 kernel is known to cause problems at this time, but this is
probably going to be fixed soon.

As usual, go here to grab the file: http://xaaes.atariforge.net

Have fun :)

I do have CVS installed but never bothered with compiling FreeMiNT
itself. Maybe I should. It's just a bit simpler to update from a binary
package.

7352. 19 issues of ST-Log Magazine at AtariMagazines.com

Newsgroup: comp.sys.atari.st
Date: 2006-07-17 21:59:47 UTC
From: Kevin Savetz <savetz-remove@gmail.com>
Message-ID: <savetz-remove-0187A8.14594717072006@news.west.cox.net>
Source record: 7979
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit,alt.folklore.computers

July 27 will be the 10th anniversary of the Classic Computer Magazine Archive (www.atarimagazines.com). In celebration, today we're announcing that the site now offers the full text of 19 issues of ST-Log Magazine. This includes more than 600 articles and a gallery of the magazine's covers.
http://www.atarimagazines.com/st-log/

ST-Log was devoted to Atari's 16-bit ST line of computers. It began as an insert in ANALOG Computing magazine in 1986. It spun off as a separate magazine for about three years, before being folded back into ANALOG again in 1989. ANALOG and ST-Log were sold to Larry Flynt Publishing in 1988. The Classic Computer Magazine Archive has permission to share the 19 issues published by L.F.P., from April 1988 until ST-Log ceased publication in 1989.

In addition, AtariMagazines.com recently added a cover image gallery for Compute! magazine, with a nearly complete collection of covers from 1980 through 1988. (The site offers the full text of nearly 100 issues of Compute!.)
http://www.atarimagazines.com/compute/

The site launched July 27, 1996 as "The Digital Antic Project" with the full text of two issues of Antic magazine. The site was later renamed to The Classic Computer Magazine Archive and added articles from STart, Creative Computing, Compute II, Hi-Res, Creative Computing Video & Arcade Games Magazine, and Tandy Whiz Kids comic books.

Enjoy!

Hello all,

I've got a Nemesis installed in my Falcon, and I'm looking for the
original installation manual if anyone has one, or knows where to get it -
I'd
appreciate it.

Thanks,

Alan.

nemesis software should be on the stos site as I put it there, I have the manual but have no idea where it is, if you cant find it anywhere or anyone let me know and i try and find it and scan it for the site.

if you want some advice though, dont bother, nemesis is "the falcon killer" , IMHO its not worth the risk of damage just to make it run a few mhz faster. Mine ran fine other than some games stopped working due to sync problems with the screen, though after hearing about just about everyone i know having dead falcons after a few months I soon took it and, and glad I did... I now have a CT60 so my falcon is still alive and boosted :)

Hi all,

Have 3,000 used floppies, in about 5 boxes, separated into packs of 50. Some with games,demos, mag disks, a lot of blank formatted ones (yes I spent the time doing that) , with and without new labels, Also have a few brand new boxes of 720K floppies in packs of 50, I think theres a couple of 1.44's boxes also, normally sell these for a fiver a box, Maybe worth posting the new boxes off, but due the amount of postage probably not worth it. If anyone wants to make me an offer then let me know. No use in posting the stuff unless you want me to, will cost a fair bit though. I am in Uttoxeter,Staffordshire (UK) if anyone is interested.

Chris

Well under NVDI I was able to use the printer in Papyrus Gold and Calamus SL.
I was able to change the fonts, size, etc. Just no graphics. I will admit that
I did not try to solve the graphics thing, so it still may have been possible.

Hey Mike. How useful is a PAL one? Can you use it with stuff
here, in the States? What about converting it? Any chance it
could be converted to NTSC some way, without too much work?

Also, does it work with the CT60 board?

Thanks! :)

Source record: 7994

For Auction (No reserve)

Falcon fitted with 14MB RAM, HD and a new NVRAM chip. The NVRAM is used in the Falcon to store the date/time and various other boot parameters and has a small internal battery to keep the settings. This chip had a lifespan of around 5-10 years and when it goes, you have to re-enter the time/date settings etc when you boot your Falcon.

This Falcon is fitted with a new NVRAM chip. It also has the clock buffer patch, and the audio patch (see the web page link below for details). There are no other modifications to the motherboard I'm aware of.

I'm also including original Falcon 'Language Disk 1' and manual, NVDI 5 with manual, Diamond Edge with manual, an adapter to let you connect a SVGA monitor to the Falcon, and an original Atari mouse.

No reserve. Thanks for looking.

From: Alan Hourihane <alan_hourihane@hotmail.com>
Message-ID: <e9o0r5pgi1$8302bc10@news.demon.co.uk>
Source record: 7998

I've got the Blowup Hard I device, but I can't seem to find my software for it.

Does anyone have it, or know a download location ??

Thanks,

Alan.

Random comment. I complained about one of those TeX drivers not working,
and someone reminded me of the Lindner distribution, which has useful
drivers for other distributions. I think I saw that distribution on some
unrelated CD, possibly N_AES.

That might be worth a look.

Yes, just once, but I really had not finished the setup. I just wanted to see
how I stood. I really was not trying to get it to load. I was more interested
in loading Mint 1.161. I paid the price though. My fat tables got messed up.
Luckily I had backups.

Thank you for your work on Teradesk, and support. I noticeably
remarked that resources from EB_Model 3 had a better aspect now.
So I can thanks from Emmanuel Baranger who worried about it
(not much, it's rather 'cosmetic'). Teradesk is very seriously
maintained, and because I use it exclusively, I really care.

I wish you fun coding further.

Best regards,

Aint it always the case!

Does STOS 3D work on the Falcon ? I can't even remember, I know it sure
don't like CT60 as I had to disable the extension to allow STOS to boot up.
I though that it didn't even work on a Stock Falcon...

Hello all,

I am having trouble running the SetMMU program (takes the place of the Hades accessary program) and Mint. It seems if I try and run it in the boot process, Mint reports that it cannot load my Mint.CNF file. If I do not run it, then Mint loads fine. Has any other Hades owner had theis problem? I am thinking it is the position of the program in the auto folder that is the culprit, so I am going to do a little experimenting.

Hello,

Thanks to Marc-Anton and Easymint 1.6, I now have a good working Mint/XaAES system. Now I understand what the talk was about XaAES. It is MUCH better then N.AES. Jinnee loads in fine and looks great in 24 bit. No problem with the color of the icons. I just have to boot Jinnee up in the booting process and not load it in after Mint/XaAES has booted.

The best part is, and I never thought it would ever be possible, is that I can now change resolution and/or color modes without re-booting. All I have left is to solve the SetMMU thing, setup my paths and add some programs to boot. Then I will use this as my main system.

STOS 3D runs fine on my Falcon, its a stock 4Mb Falcon with TOS 4.02. The
only original STOS extension which does not appear to work is the Meastro
extension, it does not record from the sampling cart for some reason.

Wish you luck with the Nemesis installation.

It isn't hard to install.
I did have a bad experience with mine. It was the 25/50
version and the buffer part worked, However the main board
did not. And it was bought brand new.
After looking back over the manual and updates, I think a big
part of the problem was due to removing two capacitors on the
Nemesis board which was suggested by a last minute addition to
the manual. It even had a picture!

It would probably work if I install the caps. but I moved on
to a Centurbo 2 B version. Liked it so much that I got another one
and is fast enough for what I do.

If you get the Nemesis working correctly 640x480 in TC mode is
possible.
The CT2B does this easily, even 800x608 in TC. I really haven't
tried to push it any farther than that in TC mode.

BTW, if you get it working e-mail me.
I'd also like to know which version you have.

Good luck,

phantomm@bellsouth.net

>
> Yes and no. I think it was CNF files mainly because I now have a working
> Mint/XaAES system after I used the newer Easymint 1.6.

CNF can be responsible for non working application, hardly for HDD crash. FAT tables are messed up if computer crashes while accesing them, etc. The only reason that MiNT may be responsible is that user mke2fs wrong (already used) partition... Iwe done that already :) Anyway, MiNT is not some fearfull application which at littlest mistake wipe HDD. I messed up CNF a lot of times (while changing them to fit all, even AES and desktop app, and tools to mint partition in /aes folder. That way no matter on what partiton i have MiNT, i only need to change sln link in mint.cnf, and all works, since all cnf files (aes and thing ones) use U:nified paths (naes path is not c:\n_aes but u:\aes\n_aes or /aes/n_aes and so on, so its not drive dependant) and really got me in troubles sometimes, but didnt lost HDD content..

looking at the web page (author R my Vanel) at
http://vanel.club.fr/index.html,
you'll see that the lastest news are from 2000 and that in 2001 Mountain
became free.
You'll find the link to download it.

(an union jack flag is present to have the pages in english).

Source record: 7894

Hi all,

Just managed to get my Eiffel interface working, and am testing a wireless keyboard/mouse. This seems to work pretty good, but there are a couple of hickups.

The main problem is that the mouse sensitivity is way too high, the mouse pointer is moved across the screen very fast even with small mouse movements. Does anybody know of a configuration program that will allow me to reduce mouse sensitivity? Silkmouse looked promising, but it would only allow me to *increase* the sensitivity.

Any ideas?

Regards,

/Joakim

Take a look at :

http://search.ebay.com/_W0QQsassZpanamajoe2005QQhtZ-1QQfrppZ50QQfsopZ1QQfsooZ1QQrdZ0?

I have :

- The Pawn
- The Guild of Thieves
- Jinxter
- Fish
- Beyond Zork
- Spellbreaker
- Times of Lore
- Demon's Winter by SSI
- Phantasie II and Phantasie III
- Questron II
- Stunt Car Racer
- Magic Pockets by the Bitmap Brothers
- Xenon 2 by the Bitmap Brothers
- Captive
- Legend
- Rubicon
- Obsession for STE
- Wolfchild
- Populous II
- Elvira

and many more games.

I didn't list all my games on ebay, if you are looking for
a game, please ask, I have many more.

You might check out CKBD 1.5. It seems pretty complete. Don't know if it
will slow the mouse down, though.

Thanks for the tip! It actually seems to be able to slow it down too,
although I have not
figured out exactly how to fine tune things. But now I am at least able
to use the wireless mouse :) Cheers!

Howdy,

This years, like the past 4 years, I spent my holiday in a beautiful
country called Czech Republic.

On one of my trips I had to take a free bus who brought me from the
zoo of Vyskov to the Dinopark in Vyskov and back.

You can find a picture of that bus on

> is the position of the program in the auto folder that is the culprit, so I am
> going to do a little experimenting.

You can NOT use both setmmu and the Hades ACC simultaneously. The Hades
ACC doesnt setup a good translation tree, and it modifies the PMMU too
late for MiNT. Also, you need to make sure you tell setmmu how much ram
you have in your Hades by chaning mmusetup.cnf. Do you get this problem
with 1.16.x versions found in xaaes alpha packets on xaaes.atari.org? If
so, read carefully the part about <sysdir>, and use the name "1-16-cur"
for the alpha versions (because they're "current CVS" binaries).

Best Regards,
Odd Skancke

I am looking for a working version of BX000962.SPD Egyptian 505 roman.

Unfortunately both files I have, originating from Compo's Font
Pack Gold, Disk 5, are faulty and crash Fontname and Arkus when I
try to display them.

BX000961.SPD Egyptian 505 Light, BX000963.SPD Egyptian 505 Medium
und BX000964.SPD Egyptian 505 Bold are OK.

Can anyone help (I suspect all English Compo versions are faulty, as
my files came from two different sources). Does Bitstream still exist?
If so, where?

Or is there perhaps a TTF equivalent?

Regards, /Peter/

7440. Any STs have universal power supply?

Newsgroup: comp.sys.atari.st
Date: 2006-08-04 11:24:01 UTC
From: Ryan <no@spam.invalid>
Message-ID: <no-DC0A4E.13240104082006@newsreader2.netcologne.de>
Source record: 7767

Hi there. After using an Atari ST briefly in the mid 90's I finally got one myself last year and have been enjoying using it with Notator to control my MIDI rig. I'm living in Germany, where STs are plentiful, and I got mine for 10 Euros, which was overpriced, but there we are.

Now it happens that I've decided to move back to the States, and since STs are much harder to find in the U.S. and much more expensive I'm considering bringing mine with me, only I've realized with some dismay that the bottom of my STf says "220-240V 50Hz" which as we know is not gonna cut it in the States without some expensive converter which I'd rather avoid.

So the question is: Did any STs come with universal power supplies? If I'm going to bother bringing an ST across the Atlantic I figure it may as well be a Mega STE, since that's the latest and greatest that'll run Notator AFAIK, but I only want to bother with that if I can be relatively sure that it'll work on U.S. power.

If there were none with universal power supplies, then I imagine getting a U.S. power supply would be just as difficult/expensive as getting the whole machine once I'm back, in which case I'd forget about trying to ship it from here and just get it there. What do you think?

Anyone else have experience bringing STs from Germany to the States? There seems to be some demand in the U.S., and a ridiculous supply in Germany.

Thanks for any help or suggestions.

P.S: Nice group you have here! I've enjoyed reading over the posts of the last half year.

Hmm, it seems to me, you've got a couple of options, as far as the P/S goes.

You can replace the P/S with a US one, Best Electronics sells them for about $115.00, last time I checked.

You could try to get a used one from Ebay. I did this just recently, picking up one for my Mega STe for $36.00, and it worked fine.

There's probably another option as well. You can use a cheap ATX power supply to run STs. I did this with my Falcon for awhile, until I got my CT60 accelerator (which the ATX P/S plugs straight into). It does require a little rewiring, but works. I'm not sure if you could find one of those micro units that would cosmetically match up to the Mega STe and fit inside without some "engineering" though.

7442. Meta STE - screen sparkles

Newsgroup: comp.sys.atari.st
Date: 2006-08-04 15:40:38 UTC
From: Alan Hourihane <alan_hourihane@hotmail.com>
Message-ID: <eavppm$fe7$1$8302bc10@news.demon.co.uk>
Source record: 7769

I have a Mega STE with 4MB RAM.

When powering up the screen at certain verical positions has sparkly effects as though the RAM was bad - but it's not.....

The memory tests are fine, and I've swapped them as well with the same problem.

The sparkle effect tends to disappear after a few minutes of warm up though.

Anyone any ideas what could cause this ?

Thanks,

Alan.

Alan, just a thought - but do you have a 2nd monitor to try, just in case
its the monitor and not the Mega STe itself? Or a 2nd ST to try with that
monitor? Would rule out that possibility anyways...

I use the monitor everyday with my TT and Falcon, so I know it's not the
monitor.

Alan.

Could you try to play some MOD-Files in STEREO on your MSTE (perhaps
with Paula or some similar programs)?

If you hear crackling sound your MSTE is one of a few machines with a
bad GST-MCU/GLUE. In this case all you can do is to change this chip
(C300589-001 U501).

I once had a MSTE like that and I also had the impression that after a
few minutes after warmup it disappeared but the crackling sound still
remained.

Regards,

Frank

I don't think there were any universal PSs, but a small
auto-transformer 220-120V should do you. Not expensive The
difference in frequency should not matter, as Ataris use
switch-mode PSs.

Alternatively, you should be able to buy a 120V power supply board
from Best Electronicsof San Jose - see www.best-electronics-ca.com
or email Brad Coda at bestelec@sbcglobal.net

7451. Mega ST and Mega STE keyboards - difference?

Newsgroup: comp.sys.atari.st
Date: 2006-08-05 01:13:03 UTC
From: Ryan <no@spam.invalid>
Message-ID: <no-772193.03130305082006@newsreader2.netcologne.de>
Source record: 7778

I haven't really paid much attention to the Atari Megas before (having used a 1040 STf) but now that I'm looking for a Mega STE I'm seeing two different keyboards depicted:

One that looks like this, with diagonal function keys and which bears a good resemblance to a 1040 STf and looks pretty neat:

http://mpc.fab.free.fr/atari/atari16-32/photo16-32/megalateral.jpg

And one that looks like this, with square function keys and IMHO an altogether more boring appearance:

http://www.betuwe.net/~mellemab/homecomputers/images/atari/Atari_Mega_STE_Large.jpg

Do each of these keyboards fit with a specific Mega, or will either keyboard work with either Mega? Is there an advantage to one or the other keyboard? (Or are there more models that I haven't found yet?) I read somewhere that one keyboard model was to be vastly preferred, but I couldn't figure out which one was meant. Going on visual appearance alone, I'd be strongly inclined to prefer the exciting diagonal function keys, but if there are other considerations, I'd love to learn about them.

According to my MegaSTe schematic, it's 0.5A. Don't know if it's
slow-blow or quick-blow. Better get a couple in case your Qwertyx is
shorting ...

The keyboards are interchangeable. The boring one as you say is for the Mega STe and the ST style one is for the Mega ST. I used a Mega ST keyboard with my falcon for a stint and now I use it on my Mega STe.

The Mega STe/TT keyboard kind of sucks in my opinion. The stupid mylar is always breaking on it. I have 8 mylars that are all trash in one way or another despite repeated repair attempts. The Mega ST keyboard tends to work better but can also get flaky. The Mega STe/TT keyboard has a fairlytypical keyboard feel. The Mega ST keyboard has a rather unique feeling that the keys press very softly with little resistance and give a satisfying clunk as they hit the limits... Total opposite of the 520/1040 keyboards. I hate those awful spongy things.

HTH,
Mark

What Mark said. I have examples of both, and guess what? Some keys on
one of my TT keyboards dont work... bad mylar. Some people will tell
you that the TT keyboard is better than the MegaST's keyboard. Don't
believe em. Open up both keyboards and you'll soon see which one is
superior, and why.

That's really cool. While on holiday in Crete this year, I spotted a computer/electricals shop that still had a big blue 'Commodore' banner across the bottom of the window. It ALSO had a 'Philips CD-i' logo there too. How many years old are these! I have a photo of it somewhere...

Hello everyone....I have a Falcon that is a German model. When I opened it up to take a look inside I found it has a small black plastic box inside with writing on the top of it " Skunk Falcon Accelerator Rev. 1.3" copyright Comtex - a German company. Checked in a red marker on it are Speed 32 mhz and FPU 32mhz (there is also a possiblity of 36/36 mhz). It is definetly fast but I was wondering if anyone knows where I could find more info. or possibly someone has a manual?
thanks for any help,

- doug

Ah, thanks Frank. I've googled a bit more about this and it seems the IC is
C301712-001
which is the IC that has the fault, whereas the replacement is C300588-001.

Can anyone confirm this, as I do have the C301712-001 device.

Alan.

Alan,

I had a similar issue with mine and had a stack of shifter chips to
replace. My video shifter was going bad. I recall there's a bad version
of the PLCC shifter and a better one. The bad one broke, the better one
worked.

Thanks,
Mark

Thanks for the responses. I looked up step-up converters today and
indeed they don't look as expensive as I had thought.

However, I also asked two sellers of Mega STEs here in Germany and they
both claim it says "100-120 ~ 50/60Hz 3.0A, 200-240 ~ 50/60Hz 1.5A"
underneath, whereas my STf clearly says "220/240V~ 50Hz 0.5A". One
seller was kind enough to photograph the bottom of his. See:

http://www.ryandesign.com/tmp/mega_ste_underside.jpg

So it looks like I'm in luck! I guess I'll get me one of those Mega STEs
then. I'll let you know how it goes!

7460. portfolio transfer problem

Newsgroup: comp.sys.atari.st

From: Jim DeClercq <jimd@panix1.panix.com>
Message-ID: <eb30f1$c2v$1@reader2.panix.com>
Source record: 7787

This used to work, transferring by serial port adapter from a Portfolio to a Stacy running Flash 1.6. Now it does not.

I should be able to get a biderectional serial link between the two machines before starting an xmodem transfer. I have had that. Now, for unknown reasons, I can type to the Portfolio screen from the Stacy, but I cannot type to the Stacy screen from the Portfolio.

I have checked configurations and port settings, and they all look right, but I do not get what I expected, and nothing happens when Xmodem tries to transfer a file.

What obvious thing am I missing?

Jim

Are you sure it's the mylars? I find the problem is usually with
the rubber cups holding the carbon brushes - these tend to break
at the bottom and then don't make proper contact. I got a replacement
set of 'TT Keys' from Best Electronics, but while these gave a
much better touch to the keys, they don't seem to last very long.

BTW, which Mega keyboard was made by Cherry and used real
microswitches? Was it the Mega 4?

In order to avoid opening the keyboard:

The MegaST keyboard (i.e. the one with diagonal function keys) has real
switches inside, as opposed to mylar in the other one. The components
were made by Cherry. Keyboard weights about 1.5kg (!), is very solidly
built and can last for decades. The keys indeed have a unique feel,
similar to what one experienced on better minicomputer terminals of that
time, which were exorbitantly priced then, and with a quality to match
the price.

Btw. I have easily repaired several mylar keyboards for PCs and calculators
using a conductive marker pen (used to repair PCBs) but IMO the whole
concept of having those thin and brittle metallic traces printed on
flexible mylar foil is wrong and unreliable.

The main problem, TT keyboard, is a trace that runs over a hard plastic sharp edge. It breaks there. General Cement Nickel Print or Silver Print applied in a tiny drop, and left to dry for a week or so should work. And then I scraped a radius on the sharp edge, put a piece of cloth tape over it, and it has worked ever since. That being said, I would really like to have one of those Cherry keyboards. They were nice enough that some now unknown person retrofitted Cherry switches to his keyboard.

Hi. I've an ST book that I'm looking to sell or otherwise free myself of:

"The ST Assembly Language Workshop" by Clayton Walnum

Slight oddity is that I removed the spine so the pages would stay open,
so it would be ideal for anyone who made a hobby of scanning in these
things.

Anyway if anyone's interested, please let me know. Otherwise I'll stick
it on eBay and see what happens.

Cheers,
Trystan

7469. DarkForce BBS IP address problems...

Newsgroup: comp.sys.atari.st
Date: 2006-08-08 18:35:31 UTC
From: "Ronald J. Hall" <dark_lord@charter.net>
Message-ID: <pan.2006.08.08.18.35.31.152273@charter.net>
Source record: 7796

Well folks, my ISP is killing me. I've got a dynamic IP address, which has been very stable for 2 years. Maybe 3 address changes in that time. Now, for some reason (techs are clueless as to why, but generally opinion is that its *my* fault), I've had multiple IP address changes in the last 3 or 4 days.

I asked about a business account, looking for a static ip address. I'm still waiting for the rep to return my call about that.

I've created an account with dyndns. I've got a perl script (ddclient) setup on my main linux box thats supposed to retrieve my ip address everytime I boot up, and every 5 mins thereafter, and update dyndns. Assuming I've got everything setup correctly.

SO if everything is working like its supposed to, everyone should be able to telnet into:

darkforce-bbs.dyndns.org

Please let me know if there are any problems.

Thanks everyone, and sorry for any inconvenience.

I dont know the TOS of dyndns, but make sure your ip has actually
changed before updating... Someone had told me if you keep submitting
an unchanged address, it somehow violates TOS, which may or not create
connection problems for you and users.

Rory

Trystan,

I have 2 duplex scanners that I use regularly for scanning in mags and
books.

Hmm, I've already got the book, but since you already have the spine
removed, I could scan it in for you and email the pdf to you. I really
dislike having to unbind a book in which I would want to keep.

Only drawback is that I'm in the US. Might want to find somebody local

Yes, dyndns mentions that - its considered "abuse". The perl script I'm
using is only supposed to send an update to dyndns if there is an actual
IP address change.

Greetings.

I need to hook up my Mega 4 ST to get some files off, but the ICD host adaptor and it's power supply have both gone dead. Does anybody have a DMA to SCSI adaptor, preferably something that doesn't require an external power supply (or else comes with such) here in Los Angeles? I'd like to get it soon, if I can.

Euh! I wrote this - and I take it back. It's about MagiC vs. MiNT:

>Personally, I think it is bad coding to not support our two major
>operating systems. They are not that different from eachother. (No
>offence guys)

They are quite different. I have first hand experience now, I didn't
have that at the time. Clean stuff written according to Atari docs
works in TOS & FreeMiNT, but sometimes not in MagiC.

Today, I see no reason why a coder should waste his/her precious coding
time messing around with problems obviously related to an erroneous
implementation of the OS. Maybe if someone publishes a list of
pre-defined workarounds that one can simply cut & paste into the
code... nah.
MagiC prevents coders from taking advantage of new features offered by
the sexy (wet blond low-moral fake-boobed) beast that is
XaAES/MyAES/FreeMiNT. I can't say that I've explored that path very
much *yet*, but I *definitely* will, and I suggest that other people do
so as well. Give Odd, Olivier and Co. a reason to continue their hard
work.

Phew, that's all. Flame me.

I agree wholeheartedly with everything said here, but would like to point out one hurdle in the way of the budding coder for FreeMiNT: modern documention on GEM programming -- and ideally a centralised source from where to get it. It's sometimes very hard to figure out one's way around GEM, and 15-years-old programming tutorials do not seem to cut it anymore.

Hope I don't sound too harsh on the people still involved. I understand writing programming docs is a pain.

Cheers,
JFL

Source record: 7809

Hello,

Following the Doom 0.53 release, here is the Heretic one, with same
improvements:

- Fixed crash in audio on exit.
- Unrolled 4x rendering loops, a bit faster.
- Tried to make 060 friendly asm rendering routines.

Note about teamtap stuff: I found people to test it, so it's ok now.

Hexen should come soon, I copy/pasted code too fast, and it crashes :-).

New release looks great so far on my Falcon/CT60, running
FreeMiNT/XaAES.

Just one thing: When I hit F7 to quit the game, pressing "Y" (for
"yes", to confirm) will not trigger the game to quit. Other than that I
have not noticed any problems at all.

Thanks for you work.

/Joakim

7486. Is there a trick to removing the STf RF shield?

Newsgroup: comp.sys.atari.st
Date: 2006-08-10 02:00:18 UTC
From: Ryan <no@spam.invalid>
Message-ID: <no-8CA271.04001810082006@newsreader2.netcologne.de>
Source record: 7813

Sigh. I am feeling incompetent. I have had an Atari STf sitting on my desk with the top case and keyboard off for days and I can't for the life of me get the blasted RF shield off. I've tried and tried. The back left corner, next to the power supply, is just stuck somehow and won't move more than about 2mm, no matter how badly I injure my fingers trying. Is this common? The other sides and corners were no problem. Is there some trick to removing the shield? Or is mine just being stubborn? Admittedly I don't have any good reason to need to look inside, but I'd like to see how it compares to the other (non-working) STf I have sitting on the floor. In can already see the logic board revisions are different. The floor Atari was no problem to open, incidentally, because it had no RF shield. (I guess I'm assuming here the shield is for RF purposes.)

Did you remove the power supply and make sure all the little bend-over
tabs are straightened out? (the tabs and their locations vary from model
to model).

7493. TT-Digger V7

Newsgroup: comp.sys.atari.st
Date: 2006-08-10 14:13:11 UTC
From: Henk Robbers <h.robbers@chello.nl>
Message-ID: <5b765$44db3ef7$3ea31819$19403@news.chello.nl>
Source record: 7820

LS

There is a new version of TT-Digger available on my home page (see sig)

Changes:

. Machines:
Implementation of MC68020 & MC68851
Machine menu choices are now complete and behave like radio
buttons.
68020 is special, because it is the only machine that can be
combined with a 68851.

. Configuration:
Completely changed and massively improved.
The improvements justified the choice of not trying to keep
compatability with pre 7 config files.
It is now very easy to recreate configurations.
So remove any existing configuration files from your system.

If you have FILE= entries in .IDX files, use a editor for
removing those entries keeping the other sections alive.

TTD has been completed with a configuration window dialogue.
No need anymore for handcrafting the configuration-file.

Configuration is also localized.
A local configuration covers everything configurable.
The local configuration is saved for each object open at
close down or at each closed object in the .IDX file, or
separate in the .IDF file when 'sidf' option is active.

Please read the updated hypertext for all the details.

. Supported formats:
The DRI format produced by the GFA compiler is now supported.
It uses a shorter form of relocation information.

. Some bugfixes

Have fun!

PMDoom 0.53 crashes under MiNT for me but runs fine under TOS. CT60
falcon. I'll try again under MiNT, maybe it was a fluke.

Thanks,
Mark

Thank you! The shield goes under the PSU! That's good to know. I got the
PSU and shield removed now.

I had tried to remove the PSU before, but there was so little room to
maneuver it and it was unclear whether the PSU was meant to be removed
before the shield or the other way around. Now I know!

Actually, looking at the posts times, I believe somebody else beat me to
this answer, so whoever it was gets full credit first. :)

I'm glad you got it sorted out though. Maybe you can take the parts from
both the non-working STs you have and make a working one? Hate to see any
STs go to waste...

It should run on any past, present or future M68K
GEM computer.

I have tested it on Milan040 and MAC-Aranym.

The 68060 special instructions are decoded purely
from reading the manuals. I have no 68060 hardware.

If TT-Digger doesnt properly disassemble the CT60
ROM's, please let me know. With adaquate description
of the problems.

Hi Henk!

Nice! Thanks for the continuous support!

BTW: in:
http://members.chello.nl/h.robbers/TTDIGGER.TXT

There is a point:
ù Output adaptable to different assemblers (GST, HISOFT, GFA, MCC,
MAS,
PASM, DevPac etc.).

I know one can set the output the output format quite nicely. But it would be great if there were some sort of presets of the output formats you mentioned: DevPac, PASM, GFA, HISOFT... etc. Perhaps an extension of the 'Look' menu or something like that?

Just an idea.

STanda

A nice idee, but I really only know PASM, thats why I leave
it to the user. ;-)

However, I could let the user record a chosen set of directives
under a name.

Perhaps next version.

Hello!

[configurable assembler output formatting]

HR> A nice idee, but I really only know PASM, thats why I leave it to the
HR> user. ;-)

I guess that some users already have customised the output to fit their
preferred assembler, so why not let them contribute their configurations
to the (TT-)Digger distribution?

I never tried TT-Digger, so maybe my proposal is not applicable due to the
way the output format is configurable.

Regards,

Alexander

You have to know the code inside and out in order to document, the only
people that really fit the bill are the people who wrote it. The people
who wrote it are either gone or still writing for it. The people who are
writing for it have so little time that time is best spent coding,
therefore nobody is left to do the docs :-P Almost a paradox.

But yeah, we would all benefit from some good docs. I really think it's
time for an Atari everything wiki. I'll be setting one up later today.

Thanks,
Mark

How about, something like this:

Code-Digger

Bit-Digger (or Byte-Digger)

Or something all together new like

Bit Nibble

or

Nibble Bit

The possibilites are endless. :)

Hello Marc!

MD> But yeah, we would all benefit from some good docs. I really think
MD> it's time for an Atari everything wiki. I'll be setting one up later
MD> today.

The point is that there must be some *central* and *well known* place
where *all* (available) information is gathered. Right now there are many
sites that come up with bits of information and few that try to offer
"everything", but they fail due to missing acceptance (I think).

Regards,

Alexander

7516. CCACHE!

Newsgroup: comp.sys.atari.st
Date: 2006-08-12 03:09:11 UTC
From: Mark D <mducksub@nospammmmatari-source.com>
Message-ID: <pan.2006.08.12.03.09.08.999576@nospammmmatari-source.com>
Source record: 7843

OH MY GOD! Where have you BEEN ALL MY LIFE!?!?!?

See folks, for those that don't build RPMs, you wouldn't know my nightmare. You see, building RPM's the build has to go from start to finish perfectly. Any interruption results in you having to restart. This is fine for small packages but this gets to be VERY tiresome when attempting to build big packages with RPM and correcting errors.

Also this REALLY hurts for building GCC.

Our falcons are slowwwwww, even with the CT60 with gcc... It just sucks.

And then there was ccache! I got it built tonight. It required some memory management code modifications but it builds and runs great now. I'll build an RPM for you guys wednesday night.

Basically it makes a hash of the C file and can figure out what files it needs to build on a make clean and which it don't. It caches the compiler output. If you compile something once. It takes the normal amount of time. Compile it twice. It happens VERY FAST. Now you can get the benefit of make clean && make without the pain of waiting.

Check it out. The first iteration with ccache running:

```
root@washi:/root/ccache-2.4>time make
gcc -g -O2 -Wall -W -I. -c -o ccache.o ccache.c
gcc -g -O2 -Wall -W -I. -c -o mdfour.o mdfour.c
gcc -g -O2 -Wall -W -I. -c -o hash.o hash.c
gcc -g -O2 -Wall -W -I. -c -o execute.o execute.c
gcc -g -O2 -Wall -W -I. -c -o util.o util.c
gcc -g -O2 -Wall -W -I. -c -o args.o args.c
gcc -g -O2 -Wall -W -I. -c -o stats.o stats.c
gcc -g -O2 -Wall -W -I. -c -o cleanup.o cleanup.c
gcc -g -O2 -Wall -W -I. -c -o snprintf.o snprintf.c
gcc -g -O2 -Wall -W -I. -c -o unify.o unify.c
unify.c: In function `unify_hash':
unify.c:245: warning: unused variable `c'
gcc -g -O2 -Wall -W -I. -o ccache ccache.o mdfour.o hash.o execute.o util.o args.o stats.o
cleanup.o snprintf.o unify.o

real 0m42.100s
user 0m29.250s
sys 0m9.730s
```

Now ccache cached this build:

```
root@washi:/root/ccache-2.4>time make
gcc -g -O2 -Wall -W -I. -c -o ccache.o ccache.c
gcc -g -O2 -Wall -W -I. -c -o mdfour.o mdfour.c
```

```
gcc -g -O2 -Wall -W -I. -c -o hash.o hash.c
gcc -g -O2 -Wall -W -I. -c -o execute.o execute.c
gcc -g -O2 -Wall -W -I. -c -o util.o util.c
gcc -g -O2 -Wall -W -I. -c -o args.o args.c
gcc -g -O2 -Wall -W -I. -c -o stats.o stats.c
gcc -g -O2 -Wall -W -I. -c -o cleanup.o cleanup.c
gcc -g -O2 -Wall -W -I. -c -o snprintf.o snprintf.c
gcc -g -O2 -Wall -W -I. -c -o unify.o unify.c
unify.c: In function `unify_hash':
unify.c:245: warning: unused variable `c'
gcc -g -O2 -Wall -W -I. -o ccache ccache.o mdfour.o hash.o execute.o util.o args.o stats.o
cleanup.o snprintf.o unify.o

real 0m9.525s
user 0m3.890s
sys 0m4.620s
```

LOL. Look at that difference. This is a MAJOR boon to atari developers using freemint! I'll get it packaged ASAP but it will take a couple days since I'll be travelling.

PS: it's just amazing to look at the files fly by, 2-3 per second, not even bothering to build!

Thanks,
Mark

The tool only caches output. more of a workaround :-P

And yeah, this isn't a crack about the falcon so much as the situation
we're in and a way to handle it better.

Thanks,
Mark

Hello Lonny!

l> Why not just contribute to this one? Seems to have a good start.
l> http://wikipendium.free.fr
l>
l> There is also one at
l> http://www.atari-forum.com/wiki/index.php/Main_Page

That's exactly what I wanted to say. There are promising approaches
already. The point is to concentrate them to one central source with all
information, linked to or mirrored by all former sources.

But I guess it's not easy to make all admins of the "distributed"
sources agree on one main URL, one common underlying system and layout.
Althouh the last could be adapted - if not user-configurable on the
central source then at least for each mirror - for different tastes.

Regards,

Alexander

Hi Ryan

Just plug it in, it will probably work as is without any messing about, the ST PSU has quite an operating latitude, no damage will be done anyway this way around.

Then "digger" it be.

"digging" can mean many things. In this context
it means what I want it to mean; to "dig" into software.

:-)

Wha-huh?! I take the logic board and shield out of the case, *then* I take off the power supply and the shield? Wow, that sure makes things easier than the way I was doing it. Totally didn't realize the logic board could come out at that stage; thought it would still be attached to the case.

So thanks for the link! I had searched for "takeapart" but hadn't gotten to synonyms like "dismantle" yet.

Oh, the one I was taking apart here works fine. It's the other one
that's broke. But now I've at least seen inside 'em to compare 'em. The
broken one has a "Rev. D" logic board, with the TOS chips under the
power supply and the RAM in two long rows at the bottom left. Looks like
this one, which is labeled "Rev. C":

http://oldmachines.tripod.com/ActPics/atari_1040open.jpg

The one that works has a different board design, with the RAM chips in a
square configuration under the power supply, and the TOS chips on the
left. Mine just says "Rev." without a letter next to it. Looks like this
one, labeled "Rev. D1":

http://www.wumpus2000.de/Homecomputer%20neu/Computers/Atari-1040ST/Atari-
1040ST-10.jpg

Except mine has the 6 TOS ROM chips, not the 2.

7529. Gigatron OHG RAM expansion

Newsgroup: comp.sys.atari.st
Date: 2006-08-12 23:52:14 UTC
From: Ryan <no@spam.invalid>
Message-ID: <no-CAB829.01521413082006@newsreader2.netcologne.de>
Source record: 7706

So the one interesting feature of my non-working Atari STf is this memory expansion thing that's installed. I figured you'd like to hear about it, or maybe can even tell me more about it.

The logic board of this Atari looks like this, though mine is labeled "Rev. D" not "Rev. C":

http://oldmachines.tripod.com/ActPics/atari_1040open.jpg

The square chip in the lower right of the logic board has been removed and a circuit board stuck in its place, and the chip placed back in a socket on the board. The chip is labeled "C025912-38 / JH23-019 / 7A1 03". There are also 8 places where additional chips can be installed on the board; every other one is filled with a chip marked "TOSHIBA 9319TCK / TC514400AZ-60 GER" which seem to be 60-ns RAM chips, though I don't know what capacity. Though since only half of the spots are filled, I'm guessing this is a 2-MB expansion card. From the board there snakes a 20-pin ribbon cable into the left side of the metal box in the center of the logic board where a similar chip hijacking is taking place, this time with a rectangular one marked "C025914-38A / PH23-024 / 6M1 37".

The only identifiable markings on the board are "Gigatron OHG" which seems to be the name of a company that made 2- and 4-MB memory expansion products for the ST back in the day, though my Google search isn't turning up a whole heck of a lot -- just a German article about the existence of the product:

http://www.stcarchiv.de/stc1990/12_ramerw.php

For anyone interested in what the article says, it begins with a lot of palaver over why one would want more RAM, describes Atari's official expansion strategy of soldering more memory chips on top of the existing ones, and then dives into the 3rd-party products which achieve RAM expansion in more sane ways. They mention the RAM piggy-back board strategy, which works a lot like soldering the extra RAM chips directly over the old ones but is a bit cleaner. And they talk about the MMU piggy-back strategy, which seems to be what this Gigatron product does. (So I guess this "C025912-38" chip is the MMU.) The article goes on to mention MMU piggy-back upgrades from two other companies.

I was surprised to hear about an MMU -- based on my experience with 8-MHz 68000-based Macintosh computers I hadn't expected the Atari ST to have one, since the Macs don't.

This Atari doesn't turn on anymore (red light on keyboard, that's about all) so it's hard to figure much out about this expansion card. Months ago, when it did at least turn on and sometimes boot into TOS, I got

Notator started a couple times and the free memory was much more than usual on my functioning 1MB ST. I also once got a newer version of TOS booted from floppy which did a RAM test and I want to say it listed 2.5MB but I don't remember for sure.

I had wanted to remove the expansion to see if it's the cause of this Atari's problems, but I can't even physically remove the MMU from its socket in the Gigatron board. I don't want to try too hard for fear of damaging it. And anyway my working ST doesn't have any square chips or sockets like the one into which the expansion plugs, so I couldn't test it there either.

So, that's all there is for now. :-)

Hi,

> But yeah, we would all benefit from some good docs.

On german there is a good starting point: TOS.HYP which is a nearly complete description of the TOS API and a very good reference. Ths document is in UDO format which allows to build a HTNL version (online on my homerpage), a ST Guide version and many other versions. We have prepared the source for multi language support. There is only left the translation of most of the text to get the english version.

> I really think it's time for an Atari everything wiki.

A wiki is nice. And if i only look for some few informations a wiki in the internet is a good thing. But i would like to have a programer document and reference as a offline version. I dont like dependencys to external sources if i had to use it very often as a reference. And i would prefer a ST Guide version for the work on my Atari. A ST Guide version is much more handy for me to use.

Regards
Michael

Hi,

>> Like what? Not something dirty in German I hope?
>
> Google translator isn't so great, but it seems to indicate it might be
> interpreted as 'graves'.

No, this is not the only association. A digger is also someonme who makes
hole in the earth to search for gold. And "to dig" is all sort of "earth work",
in german "gaben" which is also independant from graves. You can dig a
grave, but you can also dig in the garden, ...

Hi,
I have a UK Falcon for sale.

Boxed, mint condition.
60M Hard Drive
14M Falcon Wing

Not sure how much these are worth now, and would rather sell here than
on e-bay.

Any offers,
Mike

I also registered a Wiki domain for Atari, but really hasn't gone
anywhere.

http://www.atariwiki.com

Have MediaWiki setup and copied a few things from WikiPedia to it for
testing. Announced up at AtariAge, but most people felt AtariAge was
a repository of info anyway.

ahhh , yeah I know what your doing now, yes take out the entire board, in
fact I think you can take out the entire board and the metalwork all in one
go even before seperating the metalwork... I will update the images as they
look corrupted, might be worth making a copy of the page :)

I did not notice that, did you have a game started? I know it does not
trigger when the game is in demo mode (or displaying splash screen). Also,
try to press 'Y' a longer time.

Were running in fullscreen (xbios driver) mode?

I sometimes have crashes also. I run MiNT in both console and gem mode
(Xaaes) without problems. The biggest cause of crash is audio, so you can
try disabling it. Do you use the ct60 'cache 5sec' mode? I know it does
not work for SDL programs, and the cache stays off.

Pretty much spot on, the majority of ram upgrades (Marpet, Evesham etc)
piggy back the video shifter and MMU.

IIRC the 68000 doesn't have a built in MMU. It wasn't until the 68030
cam about that Motorola integrated one. It is why you cannot run virtual
memory on an Atari without a 68030 or better.

If 8 slots are full and 8 empty it will be 2 meg. Try reseating all the
socketed chips. It is amazing what a little oxidization will do.

Mark

7539. Atari SLM605 Laser Printer

First, you need a SLMC804, which is a scan converter, or serial to raster converter, which connects to the DMA port. It usually comes with a printer cable, which has some long-gone standard connectors.

BEST Electronics might help you with this.

Jim

There is the Lantronix UDS10 serial port to LAN converter. It will allow
you to do telnet and ftp easily on any Atari.

There is the EtherNEC. Its basically a NIC (network card) that attaches to
the cartridge port of your ST, TT or Falcon. It works with STing, and
there are MINT drivers as well. With it, you can browse the web, do
e-mail, newsgroups, pretty well whatever.

In the works, is the EtherNAT. True LAN connectivity for Falcon owners
with a CTxx series accelerator... USB port as well.

HTHs. :)

Message-ID: <44e1c228_2@x-privat.org>
Source record: 7729

```
New at the Belgian ftp-site chapelie.rma.ac.be
------------------------------------------------------------------

*********************************************************
* If a package should be corrupt, please contact *
* *
* tos4ever AT telenet DOT be *
* or *
* saka AT village DOT uunet DOT be *
* *
* so they can delete it and put a good version here *
* *
* Only with your cooperation this site can become good *
*********************************************************

Recently the ftp-server underwent some changes. For the moment it
seems impossible for anonymous users to make uploads to the incoming
dir. I hope it will soon be possible to make uploads to the
incoming dir.

In the mean while you can always send the uploads directly to me.

**falcon**
ftp://chapelie.rma.ac.be/atari/falcon/audio/falcamp120.zip
(259.748 bytes) GEM frontend of FalcAMP which is a MP3 player
for Atari Falcon030 computers

**game**
ftp://chapelie.rma.ac.be/atari/game/pmheretic-0.53.zip
(333.918 bytes) Atari version of Heretic.
Needs the pc version of Heretic (shareware or registered).

**programming**
ftp://chapelie.rma.ac.be/atari/programming/ttdigger-v7.zip
(145.341 bytes) TT-Digger is a program designed for digging
in existing software, for instance: TOS-ROM. Input can be disassembled,
displayed as Hexadecimal or as ASCII text in any combination.

Have fun,
Martin

Do you mean TOS.HYP 1.70 by Zorro (5.5.95) or TOS493.HYP which is
dated 5 Juli 2005? I guess the latter, as it's part English already.

At 1.75 MB in the HYP version it's quite a job to do the
translations :-(If you need some help, I could do a part, though
I am not too familiar with UDO (though I have V6) - normally I
work straight in the STG format, but I have done some UDOs, where
I just left the existing tags.

Both HYPs seem to be very useful, though I am not a programmer so
can't make full use of either!

Regards, /Peter/

He probably means TOS_494_hyp which dates from end february 2006

This version can be found on the chapelie

<URL:ftp://chapelie.rma.ac.be/atari/docs/tos_hyp/tos_494_hyp_en.zip>

You probably need to use a cable router as the Atari does not support
DHCP....

> What do I need to do this? (Hardware and Software)

See the above. Ethernec will work on any ST, others may need specific
hardware. (e.g. you can't use an ASCI on a Falcon)
However even on my TT surfing the web with CAB is intolerably slow compared
to a modern PC. I tend to use the network to back up the Ataris to the PC
jumbo hard drive....

Well folks, I've got some bad news.

The DarkForce! BBS is down until further
notice.

The Mega STe that I've been using to run
the board has apparently suffered another
power supply failure. Thats the 2nd one
in about 4 months. I had replaced the
first one with a used one off Ebay. As
far as I can tell, thats the problem.

The Mega ST that I usually use is down
until I get the MFP chip socketed so I
can try the RSVE upgrade I've got.

So I'm left without an operational ST to
run the board for now. As soon as I get
enough funds saved up, I'll either get
the Mega ST repaired, or get a new P/S
for the Mega STe.

I'm sorry for any inconvenience... :(

Is there anything we can do to help?

Chris (Exxos) and I maybe able to repair your PSU's. Find out how much
they'd cost to ship to the UK??

Mmmm. You might be able to codge an PC ATX power supply even.

Check out the hardware section of Atari Forum, Simbo has written a
series of articles about overhauling PSU's that might help.

Hrmm..
I might have some donations I can make. Let me check my stock. Remind me
if I never follow up on this as I'm forgetful as you can get :-P

Thanks,
Mark

I mean TOS493.HYP.

> At 1.75 MB in the HYP version it's quite a job to do the
> translations :-(

Yes it is. I recompiled the hyp file to stg and then converted the source
to UDO because i want to have a online version and a ST Guide version
from the same text base. And it was a huge work.

> If you need some help, I could do a part, though
> I am not too familiar with UDO (though I have V6) - normally I
> work straight in the STG format, but I have done some UDOs, where
> I just left the existing tags.

Every little help is welcome :-) My english is alittle bit weak and
i would prefer not to make translations of the text.

But i have to talk to Gerhard Stoll. We have placed the source in CVS
which allows every one to work on it. And we had prepared the source
for multi language and added a english part with the german text. So the
structure is present. But Gerhard Stoll has added some english parts
and i have to syn mee with Gerhard.

Regards
Michael

Lyndon,
Sorry, cut and paste overload. That was meant to go in the "Anything new
in the works?" section.
How is it going, it looks good, when can I order some for my STE, TT and
old old Mega 2....
Dave.

p.s. any one going to do USB storage driver. would be nice if we could plug
USB lap top drive in that USB port....

There's a thought.

Got a spare one (older) here right now. Its one of those that the 2 white connectors plug in side by side on at PC motherboard.

I've cut off one of the dead Mega STe's power supply harnesses.

All the red (+5v) matched up (3 leads)
All the black matched up (4 leads)
A single white lead matches up

That leaves a yellow, blue, and orange on each.

My understanding is that blue on Atari P/S's is +12v, and that yellow on the PC power supply is +12v.

So I can't just color-code connect, straight across.

On my Falcon, before I hooked my CT60 up to it, I had to hook the blue lead (+12v) from the Falcons harness to the yellow on the ATX power supply. I'm assuming (dangerous!) that I have to do that here as well.

Which leaves the PC side blue and orange leads.
Which leaves the Mega STe side yellow and orange leads.

Anyone done this before and can tell me for sure, what goes where before I actually connect and attempt powering up?

Thanks much gang! :)

Mark, thats a generous offer and I sure do appreciate it. :)

Let me try getting this spare PC power supply wired up first though. If I
can get it to work, it should do until I can get a real Mega STe P/S.

Thanks again! :)

I've got 2, already hacked the harness off the (really!) dead one. If you guys think you can repair the other one, I'll be glad to send it to you!

> Mmmm. You might be able to codge an PC ATX power supply even.

Thats the direction I'm going to try first. Others have suggested it as well. I did wire up an ATX power supply with my Falcon, when I recased it, before I got my CT60. It wasn't that hard. I'd be happy to have this working until I can get a real Mega STe P/S again.

I'm not sure about the connections on the Mega STe's harness though. (see my other post)

Anyone have experience with this, done it before? Thanks! :)

Hi all,

Originally distributed on the Centek website, Cecile is a harddisk
driver for Atari or compatible systems. David Godec has kindly decided
to release the sources for Cecile under the General Public License,
GPL. After the sources for AHDI surfaced recently, the sources for two
Atari harddisk driver are now available. However, Cecile is the first
one to be released under GPL.

Are we in a position to repair his PSUs? Do you still have a variac to get
110v??

I do have a 240v Mega STE back home.... And if you give me a week or two I
can come back with the pinouts from the power supply connector.

Don't worry Ron, help is on the way :) Quite impressed with how you do this
for the Atari community and I'm sure others are too. :-)

Hi Chris.

I replaced the first P/S with a used Mega STe P/S that I won in an
auction off Ebay and everything started working again, so I assumed the
first one was dead.

What it did at that time was give a white screen, or sometimes a white
screen with rows of yellow blocks on it.

It did the same thing this time... so I'm assuming the same. But I don't
really know for sure what exactly has failed...

Thanks.

I definitely would not rely on the the colors of the wire's insulators as a
guide for wiring up the machine. At best it will not work. At worst, it
will totally fry your ST.

Do some searches on Google and find out exactly what each wire is for on the ST's original power supply. Perhaps somebody in the ST group can pull out a multimeter and check each line for you. As for the AT power supply, you can use a multimeter to determine which wire corresponds to which wire on the ST.

hmmm, im sure ive seen that problem before, have you tried your old psu back
in again ? Sounds more like a ram problem, normally you don't get as far as
a white screen if the psu is bad....

Well I have done it and it does work. I used it as a way to bench test
my MegaSTE's. IIRC (and its been a while) the MegaSTE uses the same pin
configuration as an AT PSU. All you have to do is make sure that the
black wires are side by side i.e. in the middle of the block.

http://pinouts.ru/Power/MotherboardPower_pinout.shtml

Just looking at a MegaSTE atm, and it is pin for pin perfect. Pin 2
(+5v) is not used, nor is there even a pin for it on the motherboard.

In fact even the colour coding is identical on the example I have to hand.

Mark

Its the Mega STe so I can pull the ram chips very easily - there in that
lift up compartment right in the front. I can pull them, add them back in
1 at a time and try to see if one has gone bad.

I'll do that tomorrow and report back.

Thanks for the suggestion.

Hardly. I'm a respiratory therapist, working at a small, rural hospital in
E. Kentucky. I make pretty good money (for this area). My wife is an RN
who works in home health. Together we bring in about 70k a year. Of course
there are bills, mortgaged land/home, 3 cars (only 1 not paid for), and
did I mention we have 3 kids? :)

As far as money going to support the Atari community being "just tossed
away"...with an atitude like that, why are you even here friend? I do not
in any way, shape, form, or fashion consider it money wasted. You're
entitled to your own opinion of course...

See ya.

Hmm, Mark are you sure? Mind you, I'm not doubting what you are saying -
its just that I thought the blue wire on the Atari was +12v and had to be
plugged into the yellow from the P/S itself, because the yellow there is
+12v and blue is -12v.

Mind you this is from my experience from hooking up my Falcon to a ATX
style power supply. I know I had to do that with the Falcon and the ATX
one. I figured the blue on the Mega STe would be the same. I do know that
the wiring on an AT P/S and ATX P/S is slightly different.

Anyway to verify the Mega STe what the Mega STe is?

Thanks for the help!

The Falcon is completely different. IIRC you are right in that regard.
The Falcon uses blue for 12v. Have a look in the myatari archives, I did
an article on replacing the PSU. Can't recall if it was ST or Falcon
tho. But I do remember what you are saying.

As I said I have hooked up 3 MegaSTE's directly to AT power supplies and
they worked fine. I will have a look around at home this weekend, for my
notes to confirm the pinouts.

BTW I don't think even Atari would mix colour coding for 12v on these
PSU's.

Stuff it, I have a multimeter and MegaSTE handy........

OK MegaSTE

pin 1 Orange +12v (power good)
pin 2 NC
pin 3 yellow +12v
pin 4 -12v (thought so)
pin 5 - 8 Ground
pin 9 White -5v
pin 10 - 12 +5v

There ya go;-) It is standard AT.

Mark

You have to do 2 chips at a time. They are banked in a staggered
fashion. Slots 1 - 3 (Bank 1), Slots 0 - 2 (Bank 0). One chip won't work.

If you need ram mail me I have a box of 1meg simms lying around.

Okay, this has been a (painful) learning experience for me.

Here is what I've found (I think) so far.

I believe that the original culprit was memory. After removing, trying various combos (diff banks and chips) then reseating the original 4 megs, using the AT style P/S, I can boot up to a desktop.

However, its what happened before...or as Paul Harvey says, "the rest of the story"... :(

I wired the AT style P/S straight to the Mega STe connector, following the color coding exactly.

Hooked it up - turned it on - pop! sizzle! burning smell! Had my hand right on the switch so I immediately turned it off. I checked the board, and sure enough, the row of small blue chips (I'm not sure what to call them) at the back, next to the serial port and another port have 2 that look burnt.

So I've not much to lose at this point, so I re-wire the AT supply like I did my Falcon when I had it hooked up to an ATX P/S (pre CT60). That is, the blue wire from the Mega STe connector goes to the yellow wire on the AT P/S. Leaving the blue wire from the AT P/S, and the yellow wire from the Mega STe connector, unconnected.

Plug it in, turn it on - boots up normally, to a desktop. Problems - nothing works through the serial port (modem 1) now. Also, the screen is slightly "flickery". Its also unstable. I get random 2 bomb crashes, but not lock ups - at least a the reset button or <control> <alt> <delete> does reset everything.

So to sum it up, I think the memory was prob. the intial problem, although I still can't get it to boot up at all with the original Mega STe P/S. Its deader than a doornail with it connected. So I guess thats dead as well.

I guess I'll wait until I get some money saved up, send the Mega STe to somebody like Alex at ATY Computers and see if he can salvage what I've done.

Thats the bad news. See next message...

I notice my STE has
32.084988 for the main logic and CPU
8.010613 for the FDC

I am curious as to why Atari chose these seemingly arbitrary and unrelated frequencies for the CPU and FDC clocks.

32 was for the video circuit, STE is a bit different though on a STFM you
will find the 32 is pluged into the shifter for the video. It then goes to
16mhz for the input of the MMU, which then chucks out 8mhz for the cpu and
4mhz for the sound system. I think there was a 2mhz also for the modem port
I think.

What I meant was why did they use 32.084988 and 8.010613 rather than 32 and
8 MHz exactly. The latter are easy values to find and buy.

0.084988 is 1/11.766367... or roughly 3/35.2991...

I can't see a relation between any of the crystal frequencies and PAL and
NTSC colour carriers, which one might do to reduce colour dot crawl for
instance.

It isn't needed to correct PAL frame timing, as this uses multiples of 64
us.

NTSC is slightly slower than 60 Hz field rate, so one would expect a crystal
slower than 32 MHz.

don't forget the shifter is a cpu in its own right, it has to crunch
millions of bits of information 60times a second to output the video. You
might want to check out the diagrams for the ST to get a idea on whats going
on exactly.

I'm a professional electronic engineer implementing the Atari STE logic (as much as possible) in a single FPGA. I can easily get a 32 MHz crystal and divide it down for 8 MHz etc.

I have the ST circuit diagrams and can understand them well.

What I don't understand is why Atari chose crystal frequencies that are slightly off integer multiples of 1 MHz.

If I have to run several different clock domains this makes implementation harder.

This should work as long as you don't need PAL or NTSC TV output. If you look at the schematics (I remember the ST/MST version), you can see that at least in the PAL version, the 32.xxxMHz clock oscillator is part of a discrete PLL that is sync'd to the 4.433MHz PAL burst - IIRC, the HSYNC signal (which is scaled down from the 32.xxxMHz main clock) is phase-locked to the 4.433MHz clock. AFAIR, this is required to produce PAL-compliant FBAS signals. I am not sure about NTSC, though.

About the FDC: 8.000MHz would have been the correct clock for the FDC, but the slightly higher clock is still close enough to produce floppy disks that are exchangeable with other systems. Using the correct 8.000MHz, you can get a few bytes more per track, which makes it a bit easier to get 11 sectors/track with normal sector gaps.

IMHO the problem with getting 11 tracks is low-power drives. They have
enough power to accelerate the disk fast enough to read 11 tracks, but not
fast enough to write 11 tracks. I had a drive that would do both, and the
bearings were replaced with $75 each aircraft quality bearings, and it
died due to stupidity, either mine or of the people who made a circuit to
make it write a HD disk. If anyone has a really old disk drive, which
still works, I will pay an unreasonable price for it. I had one that was
as quiet as a mouse, and would read and write 11 or 22 tracks.

Otherwise, I am a quite old engineer, and know that the cheapest way to
accomplish a goal is the one that gets used.

Jim

Thanks for the info.

I suspected something like that, I just could not work out the ratio.
32.084988/4.43361775 = 7.236751071

> I am not sure about NTSC, though.

That has a 32.215905 MHz crystal.
Which is nearly 14.31818.. MHz * 9/4
Using precise values, 4 times NTSC times 9/4 is 32.21590909... MHz
So it seems that Atari used the rounded off value of 14.31818 MHz.
Bad boys!

Oh well, I think I shall use NTSC based values for both PAL and NTSC
versions.
Most modern TVs that use PAL also have SCART (PERITEL) sockets for analogue
RGB input, while NTSC TVs do not. I see the circuit just uses a
32.21590909... MHz oscillator block for the Peritel-output version.

The Amiga sensibly used a single 14.31818.. MHz crystal and halved it for
the CPU clock.

Good news. I think a simple 32 MHz master crystal is the least fuss, and if
anyone really needs colour carrier signals they can go find their own
strange crystals or use a programmable frequency generator chip.

I may get sort for saying this, though isn't 8.010613 just simply wrote as
8mhz ? Some testing I did a while ago, I ran the ST's MMU on my own 16mhz
clock and could vary the speed of the entire ST, running on 20mhz the screen
went out of sync and the sound system went faster. IMHO I really do not
think you need to worry about it that much. As long as your video system is
generating the correct video timings then I really do not see a problem ?
The worst that could happen is your scanline finishes a couple of pixels
early, or the sound may play a couple of hz out of spec, but im sure over
the millions of ST's produced that all this would vary with crystal specs
anyway.

If you *really* want to make sure, just get a normal ST, put in an exact
crystal and see what happens. I bet if you tested the timings of 100 ST's
that none of the ST's would keep exact time anyway.

Isn't it normal to have it a little over anyway ? by the time its gone
though a few buffers and dividers it would loose a bit of the "extra speed"
anyway.... I could by wrong though IMO I really do not think its going to
matter, just stick to the easy numbers....

Chris

No. If you ask for an 8 MHz crystal, you will get one.

These are a standard item.

If someone goes to the trouble of writing 8.010613 on the circuit diagram,
they would have had a good reason because a non-common crystal will not be
as cheap.

> Some testing I did a while ago, I ran the ST's MMU on my own 16 MHz clock
> and could vary the speed of the entire ST,
> running on 20 MHz the screen went out of sync and the sound system went

> IMHO I really do not think you need to worry about it that much.

Well, you do have to worry because if the video timing is not synchronised
with the colour clock you will get dot crawl on TVs using composite or
S-video input.

> I'm sure over the millions of ST's produced that all this would vary with
> crystal specs anyway.

That's not the point. The frequencies have to be synchronised within the
machine.
It doesn't matter if they are a bit different between machines.
The colour carrier oscillator has a trimmer cap so that the colour carrier
frequency can be tweaked to meet the NTSC accuracy.

> I bet if you tested the timings of 100 ST's that none of the ST's would
> keep exact time anyway.

True, but not relevant due to previous point.

> Isn't it normal to have it a little over anyway ?

No.

> by the time its gone though a few buffers and dividers it would loose a
> bit of the "extra speed" anyway....

No, buffer delays do not change the frequency of the signals passing through them.

> I could by wrong though IMO I really do not think its going to matter,
> just stick to the easy numbers....

I shall use 32 MHz exactly and by-pass colour-carrier modulation completely to make the problems void.

D-? Getting the country wrong is definitely worth an F. ;-)

But it's possible that he was suggesting you were giving Vancouver, British Columbia a bad name -- i.e. People might confuse people from Vancouver, USA with Vancouver, Canada. I think he might have been suggesting that Vancouver, Canada is better than Vancouver, USA, and sharing the same name, those from the USA give those from Canada a bad name.

But what do I know? I'm just happy that it's not me giving Canucks a bad name. :-p

I hae not done the calculations, but since the HSYNC is sync'd to the
4.433MHz PAL burst, you can expcet some rather odd numbers.

>> I am not sure about NTSC, though.
>
>That has a 32.215905 MHz crystal.

And AFAIR, they used a fixed oscillator and no PLL for NTSC - however, I do
not know enough video format details to understand *why* this worked.

>So it seems that Atari used the rounded off value of 14.31818 MHz.

Or maybe it is correct that way - some video formats employ
near-but-not-completely integer multiples for various reasons - see for
example the section n why the vertical frequency is now 59.94005Hz in
http://en.wikipedia.org/wiki/NTSC

>Oh well, I think I shall use NTSC based values for both PAL and NTSC
>versions.
>Most modern TVs that use PAL also have SCART (PERITEL) sockets for analogue
>RGB input, while NTSC TVs do not. I see the circuit just uses a

That should work. These odd frequencies are only for FBAS, when using RGB
output, 32MHz should work fine.

>The Amiga sensibly used a single 14.31818.. MHz crystal and halved it for
>the CPU clock.

Which is probably not enough for PAL: you then need to sync the 4.433MHz
color burst to the HSYNC - the Atari method makes sense, too.

I'll check again before it goes back in the box.... yellow is +12v, blue
is -12v. Just checked it.

Brad may be wrong. Personally I'd go by the positions on the board and what
a multimeter tells me rather than rely on colours.

This PSU here is also a 100-240v switchmode.. Is yours the same? Could you
take a photo of the label?

Have to disagree there. Temperature, over or under voltage, variations in
crystal composition, ancillary components. 8Mhz does not mean 8Mhz. Also
the higher the frequency, the more unstable it is. Multiple harmonics there
too.

>
> If someone goes to the trouble of writing 8.010613 on the circuit diagram,

Maybe the 8.010613 was a bodged batch of a few million crystals that were
going cheap at the time. We've seen numerous examples of this, particularly
with electronics through the 1980's. I think it was Sinclair that bought a
few million dud chips on the cheap.

Sorry to say this OP, but if you know so much about the subject and are so worldly clever and infinite, then why on earth are you on here asking these questions to us mere mortals.

Apologies for not meeting your expectations, and if you don't like the replies you're getting then what on earth ever possessed you to post on Usenet in the first place?

Maybe post these questions on the sci.electronics groups and take the same approach, for on here we're quite tame.

7631. Re: Atari ST crystal frequencies

As someone who has changed crystal frequencies a lot, by rubbing them with a number 2 pencil lead, or cleaning them with an abrasive cleaner, I do not assume that more than four digits really mean anything. There are many reasons for production tolerances, and being on the low side can be fatal for an application, just as being on the high side can be fatal for others.

And, the operating frequency does vary with frequency, and that characteristic is not on my copy of circuit drawings. If one had the normal decrease with increasing temperature, one would spec on the high side.

Does anybody remember Workman Electronics? They bought transistor rejects from TI, mostly, which did not meet gain vs frequency requirements, but would work in many applications? The sorted them by gain at a suitably low frequency into three piles, and sold them.

This should be good for another thread or two.

Jim

Exactly the same result I got. You can't mistake that with a multimeter.
Yellow is 100% +12v, check continuity between the hard drive power
connector and pin 3. As I posted earlier this is what I measured,

pin 1 Orange +12v (power good)
pin 2 NC
pin 3 yellow +12v
pin 4 -12v (thought so)
pin 5 - 8 Ground
pin 9 White -5v
pin 10 - 12 +5v

My MegaSTE is at work, I will cross reference tomorrow for you.

It sounds like the serial ports were given +12v instead of -12v. Those
blue things (inductors) are there to protect the port, if they have
blown it will mean the serial ports are open cct. Ask any Amiga owner;-).

There is another possibility, that there are more than one flavour of
MegaSTE and PSU. But I doubt it, although Atari......

> http://en.wikipedia.org/wiki/NTSC

Yes, there is a factor of 1.001 involved, but
32 / 1.001 = 31.968031 and
32.215905 / 32 = 1.00674703125.

>>The Amiga sensibly used a single 14.31818.. MHz crystal and halved it for
>>the CPU clock.
>
> Which is probably not enough for PAL: you then need to sync the 4.433 MHz
> colour burst to the HSYNC - the Atari method makes sense, too.

I've managed to get a machine running off an 14.318.. MHz crystal for the
main memory cycles with another crystal for the PAL carrier. It is no
problem, the modulator chip restarts the colour carrier oscillator after
every HSYNC.

I think what Atari did was to have the PAL oscillator nudging the master
clock oscillator into sync, which sounds a bit iffy to me. I think the right
thing would have been to have HSYNC kicking the PAL oscillator, like
modulator chips do. That way the master clock doesn't need any special
relation to the colour carrier.

Cheers Derryck... I see it has not been updated for 18 or so months...

Hmmm... anywhere in the UK sell this? I've been so out of touch with
the Atari market for so long. I guess I'll call Karl at System
Solutions to see what they can do - I have a copy of MagiCPC - maybe
they will do a cross-grade. :-)

In any case, Derryck, when is the next CCC?

Yes, actual frequency will vary from what it says on the tin.

> 8 MHz does not mean 8 MHz.

It does mean that is the frequency the manufacturer is trying to provide,
and is the one you get give or take the variation due to the conditions you
mentioned quoted on the data sheet.

Mind you, they usually round off markings for values with many digits. The
NTSC carrier value is 315/88 which gives endless recurring digits. The PAL
carrier is 8 digits. Crystals are steady enough but seldom spot-on, and
colour carrier oscillators have to be more accurate so they have trimmer
caps to fine tune the crystal.

> the higher the frequency, the more unstable it is.
> Multiple harmonics there too.

Agreed but 8 MHz is reasonably low, and 32 MHz is not too high.

> Maybe the 8.010613 was a bodged batch of a few million crystals that were
> going cheap at the time.

Possible, but I don't think it is likely. Atari were big, and wouldn't have
to make do with out of spec components.

> I think it was Sinclair that bought a
> few million dud chips on the cheap.

He appreciated the fact that things could be less than perfect but still
useful.
Early on he sold under-spec transistors to hobbyists who didn't need
perfection.
Later on he bought 64Kx1 DRAM chips with memory defects confined to one half
of the memory array, and used them as perfectly adequate 32Kx1 chips.
Certainly beat using two perfect 16Kx1 chips that needed extra power rails.

> Sorry to say this OP, but if you know so much about the subject and are so
> worldly clever and infinite

I am reasonably acquainted with electronic video systems but not infinitely so.
The reason for the Atari crystal frequencies isn't obvious to me, hence I'm asking.

> then why on earth are you on here asking these
> questions to us mere mortals.

Because it is a crystal in an Atari STE, and this is a group of Atari ST users.

> Apologies for not meeting your expectations, and if you don't like the
> replies you're getting then what on earth ever possessed you to post on
> Usenet in the first place?

Sorry for being read as brusque. I read the responses and explained why some suggestions could not be or probably were not the case.
If I write "No." that doesn't mean "No, duh!", it means "No, I haven't found that so in my experience but of course being human I may be wrong".

> Maybe post these questions on the sci.electronics groups and take the same
> approach, for on here we're quite tame.

I was thinking of doing so but for now I think I can proceed with 32 MHz (not Atari variant) crystal timing without problems. Video output will be RGB to TV or monitor so colour carriers won't be needed. If they ever are, it won't be hard to retrofit.

Weren't you a ZX81 owner? I didn't know you were into STs as well.

I hear divorce is a good way to get rid of most of your clutter in one fell
swoop, and the alimony payments stop you accumulating any more.

7647. FS: Atari STf, SM124 in Bonn Germany

Newsgroup: comp.sys.atari.st
Date: 2006-08-20 13:05:51 UTC
From: Ryan <no@spam.invalid>
Message-ID: <no-F76F18.15055020082006@newsreader2.netcologne.de>
Source record: 7624

On the off chance that there's someone near Bonn Germany reading this newsgroup just now, I have some Atari hardware to get rid of:

- 1 x standard Atari STf (TOS 1.04 chips), works great

- 1 x Atari STf, doesn't boot up at all anymore, but contains the interesting Gigatron OHG RAM expansion discussed on this newsgroup, so presumably either the ST or the RAM expansion will be functional if the two are separated

- 3 x Atari SM124 black & white monitor, work great

- 1 Logitech Atari mouse, works great

- some manner of Medusa-like serial cable with both DB-9 and DB-25 connectors at both ends

- an assortment of disks

I don't have anything to pack them up in, so this is for local pickup only. If interested in any of it, please make me an offer by emailing atari st at ryandesign dot com. Thanks.

I think I can help, as I have an ICD Link in my cables box. Contact me
at the letter "k" followed by @uia.net.

Hm - not sure, but I think this might destroy the phase relationship between
adjacent lines that is required by PAL. It should work for NTSC, though.

>I think what Atari did was to have the PAL oscillator nudging the master
>clock oscillator into sync, which sounds a bit iffy to me. I think the right

It is just a PLL (although with a high divider ratio). The scheme has the
benefit of keeping the PAL oscillator running, which avoids phase shifts
between lines.

It really is okay, signal transmitters send a burst of pure colour carrier soon after HSYNC so that the receiver has a reference to work with. It doesn't matter if the phase of the reference varies every line, only the phase encoding w.r.t. that reference alternates every line.

>>I think what Atari did was to have the PAL oscillator nudging the master

It doesn't look like a proper Phase Locked Loop, in that there is no phase detector, divider or VCO. Instead, the PAL oscillator signal seems to nudge the master oscillator. It might have a similar result as a PLL, but I don't think it is one.

The orange wire is a POWER GOOD line...
So the 0.4V is not really to be considered as a power source...
It is an open collector output from the PSU telling the hardware (the reset
circuitry if I well remember ?) that the PSU init is end and all voltages
rized correctly to their respective good level...

Hello,

More work to improve usage of 060 cpu, this time, along with usual
fixes:

PmDoom 0.54:
- Optimized a bit for 060 cpu.

PmHeretic 0.54:
- Fixed low/high detail message.
- Fixed weapon drawing in low detail.
- Missing i_system.h file in sources.
- Atari: more rendering optimizations, special 060 routine.

PmHexen 0.54:
- Added low/high detail message.
- Fixed weapon drawing in low detail.
- Atari: more rendering optimizations, special 060 routine.
- Rewritten CD music player for SDL.
- Fixed crash in audio on exit.
- Unrolled 4x rendering loops, a bit faster.

AFAIK, analog PAL receivers delay the color information by 63.943us (1 line
minus 180 degrees) and add/subtract that with the current line to cancel out
phase shifts - that would cause problems with shifting reference bursts.

>It doesn't look like a proper Phase Locked Loop, in that there is no phase

Hm - I just had a look at the schematics. I could not find the PAL version
of the MST schematic, but in the MSTE schematic (page 2, "stuffed in PAL
systems only"):

It seems that the 4.433MHz clock and HSYNC run into a phase comparator
(U203B, 74LS74), the output is low-pass filtered (R208, C212), and that
voltage is used to control the frequency of the 32.xxxMHz VCXO (cap diodes
D202, D203, ... Q202) - this definitely looks like a PLL to me, although I
might be wrong, I am more into digital design. The divider is buried inside
the ST chip set, since the HSYNC signal is basically the 32.xxxMHz system
clock divided down by some large number, closing the loop.

You're probably right, I'm rather rusty on analogue that I don't use often.
I recall a similar trick being used for a frame grabber where a 6845
generated the pixel addresses and a VCO was synced to the source video via
HSYNC.

I also have a poor scan of the circuit, it is a bit hard to read the details
clearly.

Hi Ronald,

I got a bit lost with your explanation -- did you match AT voltages
exactly or the AT supply's colored wires exactly?

The reason I ask is that Steve Sweet stated twice (2000 & 2002) that an
AT supply could just be plugged into the MegaSTE. I've never even seen
the inside of a MegaSTE, so I didn't volunteer information, but I would
like to know exactly how your supply got wired for future use.

For what it's worth, the -12V (which you seem to have fried) is used
mostly by the serial port circuitry. The +12V is used mostly for the
floppy drive motor.

Color coded wires exactly - blue to blue, yellow to yellow, etc,...

> The reason I ask is that Steve Sweet stated twice (2000 & 2002) that an
> AT supply could just be plugged into the MegaSTE. I've never even seen
> the inside of a MegaSTE, so I didn't volunteer information, but I would

Ok, I certainly don't want to tell anybody wrong here. This is apparenty tricky stuff, and its also apparently not etched in stone.

Many users, so of whom I know are very technically "savvy" when it comes to this stuff have told me that I should be able to hook an AT (note thats NOT ATX style) style P/S straight up to my Mega STe. The pinouts on the wiring harness of the Mega STe appear to match up exactly with an AT style P/S.

With all that in mind, when I hooked it straight up, thats when the blue things on my Mega STe's MB went snap/crackle/pop, burnt smell. When I hooked it up like I did my Falcon (blue atari wire to yellow AT P/S wire) then it boots up.

So whats a person to do? What has been suggested a couple of times already, at the end of the day, only trust a multimeter and read the voltages yourself, before hooking anything up. Thats my opinion.

It's been a LONG time since I had an AT PSU hooked up to my Mega STe but if I remember correctly, it hooks right up IN REVERSE. That is the black wires aren't in the middle but on the edges! This is likely what bit you. Match voltages to be sure.

Thanks,
Mark

Hi Mark.

I'm not sure (after all I've read I just get more confused) but I really
don't think thats it. I'll send you a couple of pics via e-mail as well.

Thanks.

If you hook it up in reverse you will fry it. Ground is in the middle,
same as an AT PSU. My multimeter confirms this too. There has to be more
to Ron's dilemma.
Colour coding is irrelevent, manufacturers could have made the wire
purple or pink. What matters is the voltage levels.
Can you post me the pics too Ron? Be interested in having a look.

Mark

7668. Factory pressed dvd movies, ps2, psp, xbox, xbox 360 backups for sale !!!

Newsgroup: comp.sys.atari.st

Ah, let me guess. You found some dude in Baltimore, Maryland that was getting rid of his Atari stuff for free or next to nil. Problem was that the guy was unwilling to ship the stuff because he just wanted to get rid of it. Basically, if no one was interested in coming to pick it up, he was just gonna toss it in the trash.

Not knowing anyone in Baltimore, Maryland, you could not devise a scheme for getting your little paws on the merchandise. Quickly you ran to the computer and beckoned the aid of your fellow atarians in c.s.a.8. But no one could or would help you. Long annoyed at your constant spamming of the newsgroup, few atarians were even willing to open and read your desperate plea for help, let alone respond to it by email.

Patiently, you sat before your computer watching your email account with bated anticipation. Certain that the Atari community that had served you so well over the years, would come to your rescue and help ensure that you would not lose the coveted loot you so cunningly sought. But alas, it would not happen. The loot would be lost and Bravo Sierra Computers' attempted conquest would be foiled by those annoyed by newsgroup spam.

Let it not be forgotten, that those who live by the spam, die by the spam. How tragic. :-(

My son will be going off to college in September and will be studying computer science at the massengill institute of technology. He will be needing his own computer for these studies and I was wondering what kind of system you might be able to set him up with.

Essentially, he will be needing something for word processing as well as application development, email, web-surfing, and instant messaging with other people on and off campus.

Your 20% off all educational software and books sale has caught my attention and I would really like to save some money on this investment in my son's education and future.

Thank you, and best wishes to you and yours this holiday season.

As far as HDDRUTIL is concerned it can repair a root sector (this is
explained in the manual), but not a boot sector.

Source record: 7505

Hi,

I have an old atari ST at my mom's that I would like to reuse. First of all, I'd like to fit it 4 megs to make it a bit more usable and also have some fun with the soldering iron. I downloaded a ZIP archive containing instructions about how to fit 2 SIPP modules to get a 2.5 meg ST.

However these days, it's difficult to find SIPP modules plus I have a 72-pin SIMM (4 megs) lying around that could take less space inside the ST casing (and consume less power). My main problem is how do I deal with the two memory banks ? Has anyone tried this before and published some instructions ?

I remember seeing a neat web page regarding DIY hardware mods, which worked 6 months ago, but seems to have disappeared in the meantime :(
(I think it was called Vezz's web pages or something)

Also, to facilitate the transfer of files between the ST and my main machine, I'd have liked to upgrade the floppy to HD, but alas the AJAX chip must be very hard to come by (or at a ridiculous price). Anyone has found a way to connect (say) a compact flash card to a ST ? That would be neat and work around the floppy disk issue !

Thanks for your help

It's really not necessary to continuously spam this newsgroup. Everyone on this group is now well aware of your business. Micheal Current lists your business in his 8-bit vendors directory and Ronald J. Hall even advertises your business on his bbs.

Instead of spamming the newsgroups all of the time, why don't you start participating in the discussions? You could even put a little "Bravo Sierra" advertisement in the signature of your posts with a link to your website. Maybe then, people will be more likely to do business with you, and they won't hate you as much.

Besides, what better way to advertise your business than to demonstrate real knowledge of your products by actually participating in the newsgroups? Just a thought...

I can give a go at it in about a week, but by then I probably won't have
access to the newsgroup for about a month. It'd be best to email it to
me at translator at ryandesign dot com.

Aly already wrote new docs for installing simms hardwired to an ST
http://www.retro.dial.pipex.com/stram/ Aly even posted the instructions on
this group and various forums. Just look and im sure you will find!

Errr... I agree the wayback machine can retrieve individual pages but it's a PITA for browsing a whole web site, since all other links are redirected to the non-existent web-site. Still, it's better than nothing, but in this case it's very limited since the info i'm looking for is located inside archives, which obviously are not stored on archive.org

I found a text in german (linked from the atari launchpad: great list of links btw) for connecting a SIMM to a ST, but I can't read it and Google made me laugh out loud when I had a look at its translation. Very good if you're feeling depressed but useless as a technical document.

Also, I found a working FTP site for ataris (a rare thing) and found how to upgrade a ST to tos 2.06. Alas, due to the fact that the atari techies hadn't planned that future roms would take more than 192 KB, the upgrade is quite involved and requires lots of extra circuitry that I think won't fit into the casing easily. I'll leave that to others...

Anyone up for translating the german text for real, though ? (2500 bytes)

No, it wouldn't. If a boot sector is corrupted the corresponding
partition cannot be accessed anymore. Re-installing the hard driver does
not change anything. (If the boot partition is affected you cannot even
re-install the driver since the partition is missing.)
The actual boot sector data have to be restored by special tools, like
DISKUS (http://www.seimet.de/diskus_english.html, German version only).

If you succeed in installing 4MB, you can afford to waste some on
loading TOS 2.06 into RAM. It works perfectly, just needs several seconds
more when booting.

If you happen to have the WD1772 floppy controller chip with 02-02 suffix,
it can most probably happily work with HD floppies with a very simple
add-on, see:

It's there:

Folgende Files sind in dem Archiv:

SIMM.PLT SCOOTER PCB Datei
SIMM1270.IMG IMG mit 1270dpi
SIMM_300.IMG IMG mit 300dpi
SIMM_NEC.BIN Druckdatei fï¿½r NEC-kompatible Nadler
SIMM_LJ.BIN Druckdatei fï¿½r Laserjet
SIMM.GEM Platinenansicht von unten

Falls jemand einen andere Druckdatei haben mï¿½chte soll er mir schreiben.
MausNet-Adresse folgt unten. Welche SIMMs man nimmt ist ziemlich egal, ich
hatte schon verschiedenen drin, 3 Chip, 9 Chip Versionen, vor allem kann man
beim Atari auch die mit 8Bit nehmen, die werden manchmal von MAC-Besitzern
gï¿½nstig verkauft. Da wo auf der Platine A0 steht, kommen auch in
aufsteigender Reihenfolge die weiteren Adressleitungen ran. Die
Adressleitungen werden mit 33 Ohm in Reihe angeschlossen, die RAS/CAS
Leitungen mit 68 Ohm. Die Leitung /W wird normaler- weise ohne
Reihenwiderstand angeschlossen. Auf der Platine ist zwar Platz fï¿½r die
Widerstï¿½nde der Steuerleitungen, aber wie mir ein Experte sagte, sind die
besser nahe an der MMU aufgehoben. Die SIMMs kann man nicht verkehrt herum
in die Fassungen stecken, sie kommen mit den Chips in Richtung der
Stromversorgungsanschlï¿½sse. Die inneren beiden SIMMs bilden dabei die Bank
0, die ï¿½uï¿½eren SIMMs die Bank 1. Die +5V und Masseleitungen kï¿½nnen garnicht
dick genug sein. Ich habe z.B. 4 Masse und 3 +5V Kabel von 0,75mm verlegen
mï¿½ssen, um die Speichererweiterung ohne Fehler betreiben zu kï¿½nnen. Hier

noch die Belegung der MMU (aus ST-Computer 2/92 und ohne Gewï¿½hr):

23=/W
08=/RAS0 Bank 0
07=/CASOL Bank 0
06=/CAS0H Bank 0
18=/RAS1 Bank 1
21=/CAS1L Bank 1
22=/CAS1H Bank 1
59=MAD0
58=MAD1
57=MAD2
56=MAD3
55=MAD4
54=MAD5
60=MAD6
62=MAD7
63=MAD8
66=MAD9 (Pin 64 bei PLCC-MMU, alle Pinns stimmen auch da)
Alle Angaben fï¿½r die SMD-MMU und ohne Gewï¿½hr.

Die Datenleitungen werden direkt am Shifter (das ist der IC unter dem Blechdeckel) angeschlossen: Pin 3-10 (Datenleitunge 0-7) und Pin 12-19 (Datenleitung 8-15), ohne Vorwiderstï¿½nde.

Um alten Speicher im ST stillzulegen, sollte man die Steuerleitungen (/RAS u. /CAS) ï¿½ber einen Vorwiderstand auf +5 V legen. Falls es Schwierigkeiten mit der Speichererweiterung gibt, muï¿½ man eben die Widerstï¿½nde einseitig auslï¿½ten, damit der alte Speicher vï¿½llig getrennt ist. Ich ï¿½bernehme keinerlei Garantie fï¿½r die Richtigkeit des Inhalts dieses Textes. Wer Probleme mit der Erweiterung hat, kann sich gerne an mich wenden. Zu erreichen bin ich im MausNet: Romeo Rakow @CB

You can softload the OS ? That sounds VERY nice. How do you proceed ?
Also, should I need to return to TOS 1.0 because of a game incompatibility,
it would be trivial to do.

Huh? People are measured inversely proportionate to their enemies? So you're saying that Ben is a great guy because he spams the newsgroups and makes enemies?

Everyone knows that it is bad netiquette to spam newsgroups. Ben has been repeatedly asked to stop spamming comp.sys.atari.8bit and other newsgroups, yet he persists with his spam. The vast majority of newsgroup participants have registered some form of protest to Ben's actions. Are you saying that Ben's actions make him a great guy?

If so, I humbly beg to differ. Ben has displayed nothing but callous disregard for the wants and desires of his fellow Atarians and for net users in general. How this could possibly be perceived as noble by third parties is beyond me. Especially, when it is these third parties that complain of Ben's constant spamming, block his messages from ever reaching their machines, register complaints with Ben's ISP, and refuse to read anything that comes from Bravo Sierra computers. These realities would make Ben the pipsqueak -- the man that continues to speak when virtually everyone refuses to hear his message.

Sure, Ben operates a business and provides a service to Atari computer owners. And he has every right to do so. But to conduct his marketing in the manner in which he has chosen is just bad business, poor judgment, and just plain irrational.

Several users of this group have gone the extra mile to help ensure that people know about Bravo Sierra computers. Dark Force BBS advertises Bravo Sierra computers -- for free I might add -- to those who telnet there. Micheal Current freely offers his time to compile directories of Atari vendors, a directory that lists Bravo Sierra as a seller of Atari gear, and makes it available to his fellow Atari users. And I've even seen the occasional Atari user recommend Bravo Sierra to persons looking to buy Atari gear.

I think there's a very valid point to be made here. The point is that there is a very definite line drawn on what is and isn't acceptable use of a newsgroup such as this. It is widely held that Ben's use of these newsgroups is not acceptable. As such, it is very clear that Ben does and continues to cross that line. I would hardly be too quick to place Ben in the "hero" category under these circumstances. And judging by the typical responses to Ben's posts -- or, indeed, lack of responses to Ben's posts -- Ben is not getting much mileage from his spam, or the enemies that he is making.

--
--
There are several things that I will never be:
* I will never be attracted to females.
* I will never enjoy the company of others.
Exactly how these realities bode for my enemy, is not of my concern.

Up front, I am a hold over from the precommercial use of the internet. I liked it that way. *BUT* things evolved and I had to evolve with them.

Specifically his posts are not spam. Spam infers off topic, high volume, and unwanted. His posts having to do with Atari 8 bit computers are on topic for the newsgroup. Likewise there are a number of people that use him for purchasing Atari equipment and software and want him to post here.

The history of his posts goes back a long way. Back before the commercialization of the net much of the backbone was on school mainframe computers that specifically prohibited any commercial advertizing. IIRC ~1990ish Ben was asked to remove his commercial posts as continuing to do so could mean comp.sys.atari would be dropped from their computers. At that time he complied.

With the evolution of the net Ben started posting forsale ads again. I don't know if I was the only one to talk/email Ben about his post but I did make a couple of suggestions. For one, you will notice all of Ben's posts have "AD" for advertisment in the title. He voluntarily put this in to make his posts easy to filter by people not wanting to see them. A spammer tries to defeat filters, Ben sticks his head up to make his posts an easy target for anyone who doesn't want to see them.

It was also agreed on by the majority no more then two posts per week with additional special sales OK. If you filter your newsgroup you will find Ben adheres to this agreement religiously. I can't recall ever seeing him make more then 3 posts<2+1> and never posts more then once a

week in the last decade or so.
<snip>
> If so, I humbly beg to differ. Ben has displayed nothing but callous
> disregard for the wants and desires of his fellow Atarians and for net
> users in general.

This is subjective. I should remember his name but one of our participants from Poland had something like 2,700 positive feedbacks on eBay selling SIO2PC cables. That is only eBay, he also had a web site and hawked them in the newsgroup on occasion. Thing is when a lot of people needed and wanted a cheap SIO2PC cable his posts, although commercial, were well recieved. i.e. commercial use of the internet/usenet => GOOD!

I have come to the conclusion people don't want to see commercial posts when it is something they don't need. If someone were to make daily posts selling MIOs for a dollar they would be well recieved until everyone had one, then he would become a spammer.<sic>

Well, there are several variants, but generally, you need a 'TOS image'
file (can be found on the Net), an optional icons resource file, and a
tos-loader program that goes into AUTO folder, all on the the boot disk
(or floppy disk). There is also a nice patch program to fix some bugs in
the TOS (image) and to customize it somewhat to your liking. When loaded,
TOS 2.06 takes slightly less than 300KB or RAM.

A very convenient detail is that, once loaded, it is reset-proof and
survives most of program crashes. It is even possible to create a
reset-proof 'boot' RAM-disk that will contain your AUTO-folder programs,
accessoris, etc. and still be left with a comfortable couple of MB for work.

You may have some trouble finding a suitable floppy drive though- it should
be able to run as 'drive 0' (contrary to PC requirement) and should output
'hd-detect' information on pin 2. In these days of minimum-price bare-bones
floppy drives, most of them do not have any provisions (jumpers) for
configuring- if you are lucky you will be able to divine which of the
probably unmarked solder pads should be shorted to configure the drive-
if it is possible at all.

Hi Sniperstorm. Glad to see you back online.

Piece of advice? Get an account with dyndns.org. Its free, and makes all
the difference.

Thats what I did when my ISP, for some strange reason, started changing my
IP address 1-2 times daily, and I mean everyday.

When you setup your account, you can pick a name. I went with:

darkforce-bbs.dyndns.org

You can download clients for Windows or Linux (I'm using the Linux version)

After you D/L it, install it, then, everytime you boot up your main
computer (Linux or Windows), it will check your IP address, every 5 mins,
and update that info to dyndns.org who will "filter" it down the line, so
that your users will always be able to logon to your BBS, no matter how
many times your IP address might change.

PS I just leave my main Linux box running all the time - its an NFS server
for the rest of the comps on my LAN, so it just makes it easier anyways.

No. Spam means unsolicited commercial postings. Thats what this is.
It's spam.

> did make a couple of suggestions. For one, you will notice all of Ben's
> posts have "AD" for advertisment in the title. He voluntarily put this

No they dont:

NEW FREE ATARI CATALOGS! 1 Bravo Sierra Computers (1 author) Aug
24

ATARI Adoption Agency! 1 Bravo Sierra Computers (1 author) Aug
24

Atari Back 2 School Sale! 2 AlbaClause (2 authors) Aug 25

...and thats just 3 from the last couple of days...

> spammer tries to defeat filters, Ben sticks his head up to make his
> posts an easy target for anyone who doesn't want to see them.

Just a little further would be nice...

> It was also agreed on by the majority no more then two posts per week
> with additional special sales OK. If you filter your newsgroup you will

In a democracy, voters are not harrassed when they voice opposition.
That happens frequently on Usenet, so don't tell me we voted for this
crap.

> find Ben adheres to this agreement religiously. I can't recall ever

Religious nut more like.

> seeing him make more then 3 posts<2+1> and never posts more then once a
> week in the last decade or so.

You subscribe to only ONE newsgroup then?

> I have come to the conclusion people don't want to see commercial posts
> when it is something they don't need. If someone were to make daily

Quite often I have wanted something and thought that 'Ben' might have
it, but I decided not to deal with a spammer <sic>. It's like a
government making deals with terrorists, you just don't wanna set up a
precedent...

7701. Atari STe, TT, Falcon to give away (Antwerp, Belgium)

OK, I'm still a bit lost, but we're making progress.

Mark earlier stated that he measured the voltages and found:
pin 1 Orange +12v (power good)
pin 2 NC
pin 3 Yellow +12v
pin 4 Blue -12v (thought so)
pin 5 - 8 Ground
pin 9 White -5v
pin 10 - 12 Red +5v
which is standard AT.

However, you have clearly wired (assuming your power supply isn't
bizarre):
pin 1 Orange +12v (power good)
pin 2 NC
pin 3 NC
pin 4 yellow/blue +12v
pin 5 - 8 Ground
pin 9 White -5v
pin 10 - 12 +5v
leading me to wonder first, what should you do about pin #3, and
second, why is the polarity for pins 3 & 4 apparently reversed on your
computer?

To add to the confusion, Atari wired the falcon with an 8 pin connector
RRRKKKKB (R = red, K = black, B = blue), where the red and black are
standard color coding (+5 & ground) but the blue is +12V, NOT -12V! In
other words, a standard PC power supply must use a yellow +12V wire
from the AT supply.

I hope a few others crack open their MegaSTEs and test them with a
multimeter to help solve this mystery, but at the moment I am mystified
as to why your MegaSTE should work with +12V to pin #4. Could you test

pins #4 and 8 (CAREFULLY!) with a multimeter to see whether you
actually have +12V?

Actually the best thing would be for Ronald to test his original MegaSTE PSU. I suspect Atari used off the shelf mini AT PSU's.

I think that Ron's -12v has gone open circuit which would mean 2 things. 1, his serial ports will not work and 2, that PSU pin will have no effect whatsoever on the machine.

I will dig up the schematics at some point and have a look to confirm.

Tis a mystery indeed. Like I said, colour coding has nout to do with it. BUT Atari should have stuck with using yellow for +12v.

Further, found the schematics,

http://www.janthomas.org.uk/download.html

see 2.pcx

And they do confirm my original post.

Of course you need a good backup of the boot (on some external medium
such as a floppy), then you should be able to restore. For further
help, you could try emailing the current author of Diamond Edge (me
:-)). Check my web site (www.anodynesoftware.com) for email addresses.

Hi all,

Programmer Pascal Fellerich has kindly decided to release sources for
his applications Paula and CKBD. Paula is a player for MOD-files and
the last version to be released was 2.6 but the archive also includes
the unfinished 2.7 version. CKBD is a keyboard utility that offers
users access to exotic characters by assigning key combos to them. It
also allows for key remapping and on top of that also hosts a mouse
accelerator.

Sources are available on The Orphaned Projects Page:

From Google:

"Situated in the eastern north-central US, Illinois ranks 24th in size
among the 50 states. Its area totals 56,345 sq mi (145,934 sq km), of
which land comprises 55,645 sq mi (144,120 sq km) and inland water 700 sq
mi (1,814 sq km). Illinois extends 211 mi (340 km) E-W; its maximum N-S
extension is 381 mi (613 km)."

Ah, I spent an hour looking for those. Very well then, we can
conclusively conclude (if that isn't redundant) that the MegaSTE uses a
stock AT supply. (...of how many watts?)

I spent a little time trying to follow the schematics and only found
-12V leads on chip 902 (whatever that is) and the serial ports. I
didn't see much that would be harmed by reversing polarity, but I'm not
particularly skilled with electronics. However, I rather suspect it
might be a good idea for Ron to wire is computer correctly!

That probably isn't too helpful, unless you can easily visualize REALLY
BIG things.

Here's another way to look at it:

Illinois is about the size of England and Wales combined. It has only
about 1/4 the population though, and 2/3 of the population is
concentrated in the extreme northeast corner of the state (the Chicago
metro area), which allows the rest of the state to be relatively
lightly populated and agricultural.

As for the United States, if you include Alaska (which is, after all a
state), the US is nearly the size of Europe, although it has well under
half as many people.

Hi here,

The MacOSX version of ARAnyM has been enhance thanks to the
work of Philipp Donzé, and every Mac user should have it :)
Especially if you're running on a laptop ! The updated version
is available :

<http://eureka.atari.org/MacAranym.zip>

Please comment. You're welcome ! It look like :

<http://eureka.atari.org/aranym.gif>

Regards,

The instructions on the website state that fdrawcmd has to be installed first which is fine on the PC at work as it has in internal floppy driver, however when if I try installing fdrawcmd on my laptop for the previous version it said something along the lines that can't find the driver. This is probably because the floppy on my laptop is an external USB floppy. Does this version work with USB floppy drives and if not is that a feature that may be introduced to later versions?

Great. Can we send all of our cultural displaced bodies to you? We're at total breaking point. :-(There's practically not even a single square mile here which isn't populated.

You'd love the Poles there, they'd leer at all of your women and shove them out of the way in shops. (would like to see how that would work out over there actually, could have some interesting biteback, here if we question it we're accused of being anti-social by the PC brigade).

A few Atari related things here:

http://www.users.zetnet.co.uk/phwilliamson/atari.html

(all old and well-used)

Mega ST2 power supply.
Mega ST2 keyboard.
Cover disks from Atari World magazine.
Power Supply for Syquest EZ230 drive.
(The picture shows a close up of the voltage details.)

Yours for the cost of the postage if they are any use to you.

Cheers

Paul Williamson

Fdrawcmd is made for 'regular', built in floppy drives.

USB version will be made hardly ever. And even if someone will do it,
it will not work
good with all external USB floppy drives, especially not with non-PC
standard floppies.

I can only say that find someone with desktop PC, and perform floppy
imaging on it.

Aly,

To give some perspective, to drive partially across the country, you can
drive at high speeds for 24 hours and still not quite be there, when it
comes to traversing vertically. Horizontally to go coast to coast takes
3 solid days of driving with 2 drivers so 1 can sleep. America is huge.
Lots of farmland and forests, deserts, etc.

Thanks,
Mark

The author replies...

8 chips eh!? Pass. They're still addressable though. It's not as if the MMU went through a significant redesign. If you focus on what the MMU is doing rather what RAM you see in front of you then this will be a whole lot easier.

The signals are picked up from the resistors for two reasons. Firstly to remove the existing DRAM from the equation. And secondly, it's easier to solder to the resistors than it is to PCB.

If you don't remove the existing DRAM or disconnect it then the upgrade will never work.

Also at the bottom of that write up is a link to a Stacy upgrade, which I think uses the same chips as your 1040.

Where are you based Jerome, is France? Would you like to buy an upgraded 4Mb pull from one of my STFM's? I'm looking to sell off most of my kit over the next few weeks to fund breast augmentation so you're more than welcome to the board. I could send an entire STFM although that will definitely push the postage costs up significantly. The important bit is keeping Airmail below 2Kg which I think a motherboard will be.

Your upgrade is entirely achievable, just focus on what the MMU is doing and
forget about those 8 chips. Trouble is that they fill up an entire bank.
The other bank would allow 2Mb to be added without killing the bank0 chips.
Yielding 2.5Mb.

Hope it works out :-)

Alison

7743. New CT63, 060 R6, CTCM, Coolers & PGA sockets

Newsgroup: comp.sys.atari.st
Date: 2006-09-01 12:55:41 UTC
From: Rodolphe Czuba <rodolphe.Beurkcaca.spam.czuba@free.fr>
Message-ID: <44f82dcd$0$15667$626a54ce@news.free.fr>
Source record: 7570

Hello,

I confirm you now that a small quantity of CT63 & CTCM will be produced in the few days.
Some low profile Cooler (used on the CT63), some 060 rev.6 (running at 90 MHz at least) and some PGA (68060) sockets will be ordered too.

I need to pay the factory and furnishers NOW when giving the start.

You can check infos about CT63, 060 rev.6, CTCM and low profile cooler on www.czuba-tech.com
You can check prices and shipping cost for all these parts on http://www.czuba-tech.com/CT60/english/prices.htm. (replace 'english' by 'french' for France)

If you order, you have to pay now. The reservation will only be valid and registered if I get your money.
- Be carefull for payments by PAYPAL (my email address) : paypal takes 4% of charges, so you have to add 4 % on the total (price + shipping)...
- Be carefull for bank transfer payment (contact me) : give instructions to your bank to pay all banks charges (those from your bank and those from the arrival bank (mine). I want to receive the correct amount of money... Please pay with Switzerland money (CHF). Actual money conversion rate is 1.58 (300 EUR = 474 CHF as example).
- You can pay by cash money in a letter but take insurance for this letter, sure !

Last things :
- shipping of all these products will be effective in October (yes, I will be fast this time !).
- If your email or geographical address has changed, LET ME KNOW ! I will not be responsible for packet lost. I removed 2 CT people of this emailing because bad email address !
- All shipping of packet (not the letters = items A) will be with tracking number and signature at delivery.

Best Atarian Regards

Rodolphe

ICD made "DMA" cables, though they were just a DMA extension cable,
basically just a D-sub on each end. The auction does not state its actually
a cable with SCSI on the other end, thats something totally different.

Yes I know all this now, I spent my last few days reading every doc I have on
ST ram upgrades in detail, including your doc from last year. I think I can
say "I have a feel"

>Also at the bottom of that write up is a link to a Stacy upgrade, which I
>think uses the same chips as your 1040.

Mine uses TC514256 chips, this is a 256k x 4 memory configuration. In fact
there should be less wire to solder, and less chips to desolder, which will
make things less stressful.

>Where are you based Jerome, is France? Would you like to buy an upgraded
>4Mb pull from one of my STFM's? I'm looking to sell off most of my kit over
>the next few weeks to fund breast augmentation so you're more than welcome
>to the board.

The point of this mod is doing it myself and (hopefully) learn a fair bit
more about electronics than I currently do. So, at the moment, I'm afraid I
can't do anything to your breast augmentation problem ;)

However, should I fry my board beyond all hope, maybe I'll call you for a
ready-made board. I saw on some of your pics how pretty your mods can be.

> I could send an entire STFM although that will definitely push the postage

> bank. The other bank would allow 2Mb to be added without killing the bank0

> chips. Yielding 2.5Mb.

I think you misunderstood (or maybe it's me ;))

Each chip can output 4 bits at a time, that makes 32 bits, which is twice the width of a memory access. 4 chips (with sockets U3 to U6) make up bank0 while the 4 others make up bank1 (U10 to U13).

>Hope it works out :-)

Fingers crossed :)

PS: There's a small typo in your document when you say "b. D0 thru D32 are the data/chip lines".

From: Jerome Mathevet <jerome.mathevet@freeNOTMYFAI.fr>
Message-ID: <d286bd5f4e.jerome@jerome/mathevet.free.fr>
Source record: 7574

In message <5e43705c4e.jerome@jerome/mathevet.free.fr>
Jerome Mathevet <jerome.mathevet@freeREMOVETHIS.fr> wrote:

[snip]

The original german text can be translated to (thanks to Peter West for doing
the translation work):

The following files are in the archive:

SIMM.PLT SCOOTER-PCB file
SIMM1270.IMG IMG at 1270dpi
SIMM_300.IMG IMG at 300dpi
SIMM_NEC.BIN Printing file for NEC-compatible pin-printers
SIMM_LJ.BIN Printing file for Laserjet
SIMM.GEM PCB (printed circuit board) view from below

If anyone would like to have a different printing file, they should
write to me. MausNet-address follows at end.

Which SIMMs one uses is fairly irrelevant; I've had various ones in,
3 chip, 9 chip versions, above all one can also use those with 8 bits
on the Atari, which are sometimes sold cheaply by MAC-owners.

Where the PCB is marked A0, you also place the other address lines in
ascending order.

The address lines are connected via 33 Ohm series resistors, the
RAS/CAS lines via 68 Ohm.

The line /W is normally connected without a series resistor.

Though the PCB has room for resistors for the control lines, but -
as an expert told me - these are better placed close to the MMU.

The SIMMs can not be inserted the wrong way round into their sockets,
they should have the chips facing the power connections. The two inner
SIMMS form Bank 0, the outer two SIMMs Bank 1.

The +5V and ground connections cannot be thick enough. I, for instance,
had to fit 4 ground and 3 +5V wires of 0.75mm in order to be able to
use the RAM expansion without errors.

Here follows the pinout of the MMU (from ST-Computer 2/92 and without
any guarantee):

23=/W
08=/RAS0 Bank 0
07=/CASOL Bank 0

06=/CAS0H Bank 0
18=/RAS1 Bank 1
21=/CAS1L Bank 1
22=/CAS1H Bank 1
59=MAD0
58=MAD1
57=MAD2
56=MAD3
55=MAD4
54=MAD5
60=MAD6
62=MAD7
63=MAD8
66=MAD9 (Pin 64 for PLCC-MMU, all ?other? pins match there too)

All information for the SMD-MMU and without guarantee.

The data lines are connected directly to the Shifter (that is the IC under the tin lid): Pins 3-10 (data lines 0-7) and pins 12-19 (data lines 8-15), without series resistors.

To disable the old memory in the ST, one should connect the control lines (/RAS and /CAS) via series resistors to +5 V. If there are problems with the memory extension, one has to desolder one side of the resistors so that the old memory is completely isolated. [Translator's note: Not clear which resistors are meant here - presumably those mentioned above, but this is not explicit in the original text.]

I offer no guarantees for the correcteness of the contents of this text. Those that have problems with the extension can get in touch with me. I can be reached in the MausNet: Romeo Rakow @CB

Now someone smarter than I will put this translation inside the original archive and put it on the classic FTP sites for ataris.

Yes I agree. I did not post to the Swap Meet on the Usenet until this
week but I did post it on Atari.org, Atariage, AONE, and other places in
July. I just didn't get it here on the Usenet until now. Mostly
because I kept forgetting and all last week my Usenet access did not
work with my ISP but mostly my bad.

7750. Any Atari collectors out there?

I was doing some housecleaning, and found an SX-212 modem in the original box. The documentation and the serial cable are missing, but the power supply and modem are there (no earthly idea if they work, especially since I don't have a cable), as well as all the original packaging.

I know it's not worth anything other than maybe sentimental value to someone, so if anyone out there wants it, drop me an e-mail, and I'll send it to you for the cost of shipping.

The Hara Arena (convention center) in Dayton, Ohio, says there
will be no Computerfest held there this year. Has anybody heard of
any other location where this show will be held? Or has it finally
died off (after more than 20 years)?

Guess the Internet made the deals much less attractive. Seemed like the
last few I went to only had a few vendors in multiple spots. The show wasn't
worth the price anymore but they added seminars that I thought were.
Various subjects including Linux. Evidently a lot of people didn't agree.
Didn't make it last year but year before was only 2 not full rooms. Hard to
imagine what was such a huge show could go away.

Here's what the organizers have to say.

On the STacy, well under it, is a small metal access door that is held on by one screw. Under the door are 2 Socketed chips.

Are these the TOS 1.4 chips or are these something else?

If they happen to be TOS chips, Can one plug in 2 TOS 2.06 chips?

I started going to the Dayton Computerfest about 1985, and went almost every year until around 2000. But (IMO) online computer sales and auctions have killed off most of the business that the vendors traveling the computer show circuit once enjoyed. Check the announcement at: http://www.dma.org/
For maybe 8-10 years, DMA also had a spring computerfest, and I could see it wither as the years went on. Then they dropped it. Other computer shows that once were pervasive have suffered the same fate. Just as the PC's crowded out the other platforms, the internet sales have crowded out the shows. It is regrettable, but evidently there were lots of people like me -- why travel to a show, fight the crowds, and have an inferior selection/price as compared to what is available as I surf the net? And if you are a seller, why not set up a site on the internet instead of loading up equipment, driving, setting up, etc.

Have a look here:

http://www.system-cfg.com/pages/atari_stacy.html

Further down the page, you can see 2 chips with adhesive tape. These are the
2 EPROMS containing the TOS (not necessarily 1.4).

Upgrading to 2.06 (which is possible on the stacy, according to
http://gem.win.co.nz/hall/tos_206/guide206.zip) would be much easier compared
to doing so for an ST since you'd only have 2 chips to program (presumably 2
27C1001 eproms or compatible).

One chip should hold the LSB and the other the MSB of TOS 2.06 (which is
which should be marked on the motherboard).

All you need is someone with the right EPROM programmer and the TOS roms
split over 2 files (LSB/MSB). Perhaps you need to configure jumpers so that
the machine knows of the bigger size EPROMs.

How much would you like to pay? Given that 1Mbit EPROMs are hanging about
£5ea. at the moment, £15+postage.

(yes £5 may be expensive people, but I'm not putting myself out to save a
few quid, walk down road into shop, hand money over, thank you grubby
electronics person)

Hi,

Could anyone shed any light on a TOS version 108?? It doesn't exist?

The image that follows explains all;
http://www.logicsays.com/ebay/01_09_06/image7.jpg

I've tried it with 1.4, 1.62, 2.06 and it's not playing ball. I had it running on a machine months ago which I don't have any more.

Any suggestions? I've just sold it. And from what I'm finding out through searching it's ultra rare.

Thanks in advance,

Alison

Oh, the disks are also unreadable too. I don't think they're corrupt, more the OTT copy protection that they used with it. It is mentioned on some of the other forums as being difficult to crack, in that the few cracked versions out there regularly crash.

7771. August Winners/September Prizes at DarkForce!

Yes, I tried booting up with that. With the copy protection on the disks making them unreadable I didn't know where to go next. Rebooting with the discs in didn't work either.

I'm guessing this is TOS1.0 or 1.2 since I had this game working on an old STFM a few months back then stripped it down for parts. :-(

Thanks :-)

Aly

7776. VME info

Newsgroup: comp.sys.atari.st
Date: 2006-09-07 04:16:00 UTC
From: Simon Gornall <simon.gornall@mac.com>
Message-ID: <20060906211600275 44-simongornall@maccom>
Source record: 7453
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Has anyone got any in-depth technical information about how the TT/MSTE
and their VME bus interact ? I can find *some* stuff on the web (eg:
the 19/7/1991 Atari VME spec), but it's hardly comprehensive [grin]

Basically, if I want to create some VME hardware, I need to know things like:

- how it'll interact with the OS
- It's supposed to be slave-only, so presumably can't initiate DMA...

- what the startup sequence is
- card sends IRQ ?
- OS queries address and expects response ?
- When in the bootup-sequence all of this happens ?

... things like that :-)

I've tried sending email to Mario Becroft (of the Galaxy card fame),
and I've even tried emailing the creators of a Sinclair QL VME-bus
implementation, but no answers back as yet :-(

Anyone ?

Cheers,
Simon

Hello Tom Tom!

> Do you know by chance if the format of the drive is the same as the regular
> ST or if it is the same as the TT/Falcon?

The "format" of the ST-Book-Drive is a 2,5"-drive as used in
notebooks/laptops.

> Since the drive is IDE, can any drive be used in it or does it require
> certain models?

If I remember corectly these machines had problems with drives bigger
1GB capacity, so if you find somewhere a 500MB-drive it should be
possible to install.

> What means will the drive need to be formatted and with what software is
> recommended?

Is there a "format-software" (AHDI sp?) in ST-Books permanent RAM-Drive
(I don't remember...)
Otherwise the best chance is to take a FALCON (only other Atari-machine
with a 2,5"-drive"), put the "new" ST-Book-drive in it, format with the
software from the "language-disk" or third-party-software as "HDDriver",
and put this drive then in the ST-Book.
Voilà - Should work...

Best Regards, Werner

YES it is SLAVE (A24/D16) and you can see on the schematics !
On schematics you can see too how are routed the VME INT and that the SCU
(System Control Unit) is managing the share between the INT from the mb and
the INT from the VME slot. You have info on this VME atari 1991
documentation that is extracted from TT/X documentation you mean...
Have a look on my site web (museum area ?), there are some documents...

Have a look too on the CTLink Hardware Guide because I did a table will all
existing VME atari card and their INT level used !
I send you now by email this CTLink doc.

Hi all,

Sources for the programming utility X-Debug, written by Andy Pennel,
has been released to the public. This piece of software is a debugger
that mainly targets Lattice-C but may offer some functionality for
other languages as well. Thanks to being distributed under a very
generous legal license it seems that people are free to do whatever
they want with the sources.

Read more and download the sources here:

```
This is a bad information !!!

TOS 1.0 to 1.4 are running on $FC0000 to $FEFFFF (192 KB).
TOS 1.6, 2.6, 3.6 & 4.04 are running on $ E00000 to E7FFFF (512KB area :
256KB with shadow on all except Falcon)

Stacy is decoding TOS area on $FC, so the TOS 2.6 cannot run simply plugging
the two 1Mbits EPROMS !!

You need to add an address decoder to do that !!

The interface *is* available commercially, but it seems a bit pricy to me (around $70 US each, including shipping). I would think the same price as the PeST would be more reasonable, but what do I know? I'm looking for 2 interfaces too, and was wondering whether to build them myself. I'd be happy to start from a PCB & locate the parts / do the soldering myself, but I'm a little leery about getting into PCB ordering for the first time ...

This could be a good project for someone with hardware expertise (hint, hint). For the right price, I'd buy at least two ...

This is great news (especially for us Lattice C users)! I found Andy's MSDN blog by chance earlier this year and asked him about releasing xdebug, since I wanted to make some enhancements. Never heard back, but maybe it gave him the idea ...

Hi Roger,

Trouble with them is that for 1-off's and alike, they're quite time consuming to build, test etc. The last one I built I did for £50inc. but this was before the dollar started dropping like a very heavy stone.

To bring into perspective somewhat. 25 PCBs alone given the size of Eiffel and alike, would cost about £250-£300 (yes it can be done cheaper but where, shipping, quality, EM testing?). And with my calculator.. that's about £10 for the PCB alone. £3 for the chip. £1 ea. for the 9 pin D's. £1 ea. for the PS2 sockets. In such small quantities there is no discount from the trade suppliers for buying a few bits here and there.

It's the same thing with PeST, where in short runs they just cost so much to build.

I've had some quite childish emails from people in the past wanting to buy and then firing off a barrarge of abuse about how expensive PeST is. I'm not a large company producing them by the thousand. I don't have a villiage family of 7-year olds building them in China for 50p a piece.

My response as always with these mails that trickle through eBay is always, if you don't like it and aren't prepared to pay for my time, then build it yourself or go to your local thrift store and see if you can find one there.

This is partly why the people who have built Eiffel in the past have given up. It simply isn't worth building them, especially with the hassle. People continue to ask over and over for them, there's a wealth of posts on the forums, and when they find out how much they are, they start complaining, thinking that they should be paying the prices of the 1980's,

when.

*inflation was much much lower
*devices were manafactured for a mass market

The people who have bought PeST have stuck with me, and I have huge respect for, mainly for retaining some objectivity and realism of how much things cost. And if I start doing 'deals' for the occasional person that complains then that's just a slap in the face to all those that bought out of sheer honesty and genuine need.

At the moment I'm selling off my all of my Atari kit. With the last investment into PeSTs I've just about broke even.

Not sure how I feel at the moment. Had nightmares last night about where I worked a few years ago and friends I had around me, Dad has terminal cancer, I'm tired, and a few other things.

:(

Aly x

ps. not really replying to you there Roger, just voicing everything to all. (((((((hugs)))))))

Ah yes, I forgot about this, Mea maxima culpa.

> Stacy is decoding TOS area on $FC, so the TOS 2.6 cannot run simply
> plugging the two 1Mbits EPROMS !!
>
> You need to add an address decoder to do that !!

I figured the Stacy would include the logic to do that, frankly, since the
atari enginneers managed to put the original ROMs in a set of 2 chips. Some
jumpers to configure for whatever size of ROMs is installed would have been
great too. Yes, I know "hindsight is wonderful thing".

That makes me think. I saw the 1040STFM motherboard has jumpers for ROM size
configuration (256K/1M). How are you supposed to use them ?

I would have expected this to include the so-called address decoder you were talking about since it's pointless to have 256 KB roms if the OS doesn't have the required space to access them all if they live from $FC0000 to $FEFFFF

That was wishful thinking from me, it seems.

7799. [?] Quake Game

Newsgroup: comp.sys.atari.st
Date: 2006-09-08 20:37:24 UTC
From: Francois LE COAT <lecoat@atari.org>
Message-ID: <4501d484$0$27398$ba4acef3@news.orange.fr>
Source record: 7476

Hi,

If you read at <http://www.dhs.nu/> you will catch the following news :

Source : Dead Hackers Society

Falcon060 Quake released by Mystic Bytes September 7, 2006

MiKRO of Mystic Bytes has released a new Falcon060 port of the classic
PC game Quake by ID Software.

The port is especially made for the Falcon, so it's unlikely to work on
clones or Aranym.

One thing I've done, is to take <http://eureka.atari.org/MacAranym.zip>
I deactivated fVDI, to be in a Falcon 256 colors compatible graphic
mode (the TSR is in the AUTO folder), and booted with TOS4.04 rather
than EmuTOS.

To get a '.pak' suitable for Quake I then downloaded the shareware

<ftp://ftp.idsoftware.com/idstuff/quake/quake106.zip>

and placed the unarchived 'ID1' folder at the same level as the .TTP.

Then I had to launch the Quake 1.06 binary, and all worked fine
including Quake's sound. The JITc is not activated in MacAranym, so
no problem. But you may have to deactivate it in the requisite case.

Then, let's enjoy this addictive game ;)

Best Atarian regards,

Well ... I had a little help from my friends :)

You may download <http://helijah.free.fr/quake.zip> (8,4 Mb)

that works right away.

Do not confuse Kb & KB....
You can use 6 chips of 256Kbits (32KB, what does 192 KB of total) or 2 chips
of 1Mbits (128KB, what does 256 KB (yes, 64 KB are lost !)).

That is like this an all ST, STF, MEGA ST & STACY computers !

Correct.

There is no such mechanism - the OS basically ignores the VME card, you need
to start required drivers by some other means - from the auto folder, as a
NVDI driver, etc..

The slot in the MSTE/TT is slave-only, A24/D16, one (vectored) interrupt,
the bus timing is quite similar to a native 68000 bus. The card needs to
pick a free address range that does not collide with other devices in the
system - the available addresses are more limited in the MSTE.

Doesn't a Quake version for Mac exist? IMO it sounds like quite a
detour to go through the emulation route to get such a game running on
hardware that has native (and thus probably a lot faster) versions.

Regards,

/Joakim

Aren't you interested in ATARI sides of things ?

Regards,

Hi

Yes I still make them and still available at fujiman.no-ip.com.

Thank you,
Rory

I am sure he is. ON Atari though. It is an insult to run software in which coder puts a lot of effort to optimise original code (not a straight port), spent days of getting it fast enough on some emulator... and XXX GHZ machine...

Janez

In fact, I had TOS 2.06 in mind for the 256 KB size (yes, this is KB).
I thought the jumpers would have allowed a smarter upgrade for the ST/Stacy.
I'm a bit disappointed...

Thanks for the clarification anyway

You probably don't know much things about coding. I'm a developer, and
